

Metal-Organic Frameworks: Applications in Heterogeneous Catalysis

Jack Terrett
MacMillan Group Meeting
June 19th, 2013

Porous Materials

■ Zeolites

- Aluminosilicate minerals (purely inorganic)
- Widely used in heterogeneous catalysis on an industrial scale
- Structurally stable at high temperature
- Applications in gas separation, petrochemical cracking, and water purification
- Accessible and highly organized pores/cavities (pore size typically below 1 nm)

Porous Materials

■ Zeolites

- Aluminosilicate minerals (purely inorganic)
- Widely used in heterogeneous catalysis on an industrial scale
- Structurally stable at high temperature
- Applications in gas separation, petrochemical cracking, and water purification
- Accessible and highly organized pores/cavities (pore size typically below 1 nm)

■ Mesoporous materials

- Silica and alumina based
- Large pore sizes (2–50 nm)
- Amorphous structure with disordered channels

Porous Materials

■ Zeolites

- Aluminosilicate minerals (purely inorganic)
- Widely used in heterogeneous catalysis on an industrial scale
- Structurally stable at high temperature
- Applications in gas separation, petrochemical cracking, and water purification
- Accessible and highly organized pores/cavities (pore size typically below 1 nm)

■ Mesoporous materials

- Silica and alumina based
- Large pore sizes (2–50 nm)
- Amorphous structure with disordered channels

■ Activated carbon

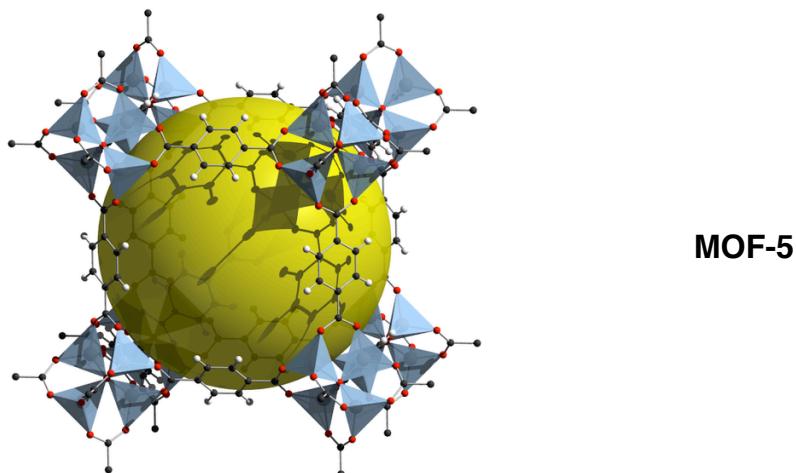

- High surface area and open porosity (variable channel sizes)
- Disordered: hexagonal carbon layers with various cross-linking
- Numerous applications in gas sorption and catalysis

Porous Materials

■ Metal Organic Frameworks (MOFs)

- Metal Organic Materials (MOMs), Porous Coordination Polymers (PCPs)
- Combines inorganic nodes (metal ions or clusters/SBUs) with organic linkers/struts
- Permanent microporosity (pore sizes typically range from 5 Å – 2 nm)
- Synthesized under mild conditions, low thermal stability (compared to zeolites)
- Facile modification of starting components
- Predictable structure and reactivity enable fine-tuning for desired application

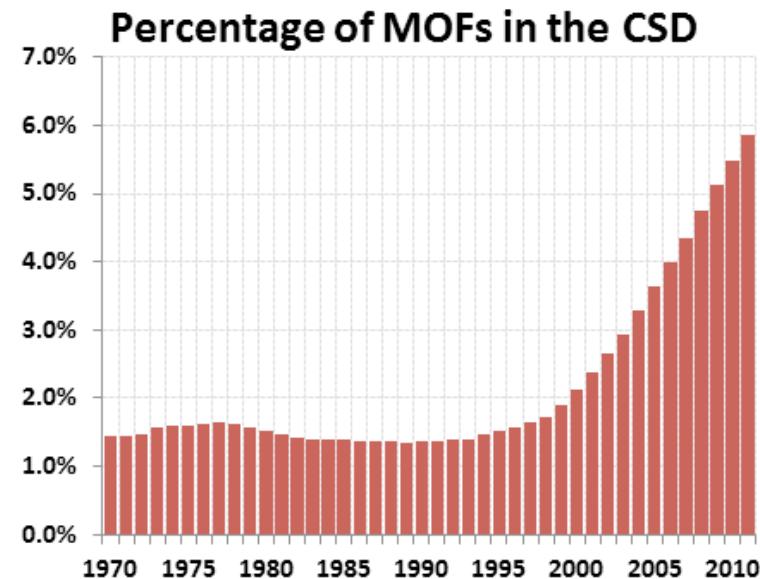

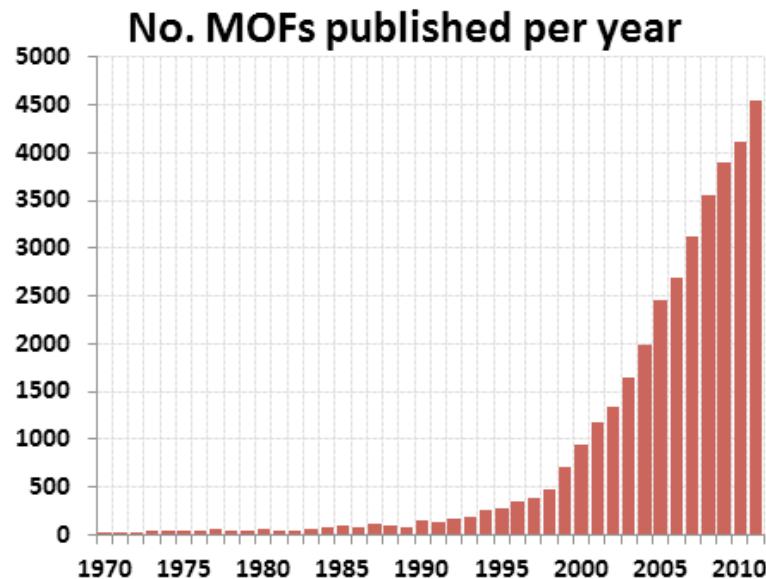

MOF-5

Metal-Organic Frameworks: Design and Application, Edited by L. R. MacGillivray, **2010**, John Wiley & Sons, Inc.

Metal-Organic Frameworks: Applications from Catalysis to Gas Storage, Edited by D. Farrusseng, **2011**, Wiley-VCH.

The Explosive Growth of Metal-Organic Frameworks

- The number of reported MOF structures has increased dramatically over the past 40 years

Cambridge Crystallographic Data Centre (CCDC) Blog, Pete Wood, 9th January 2013

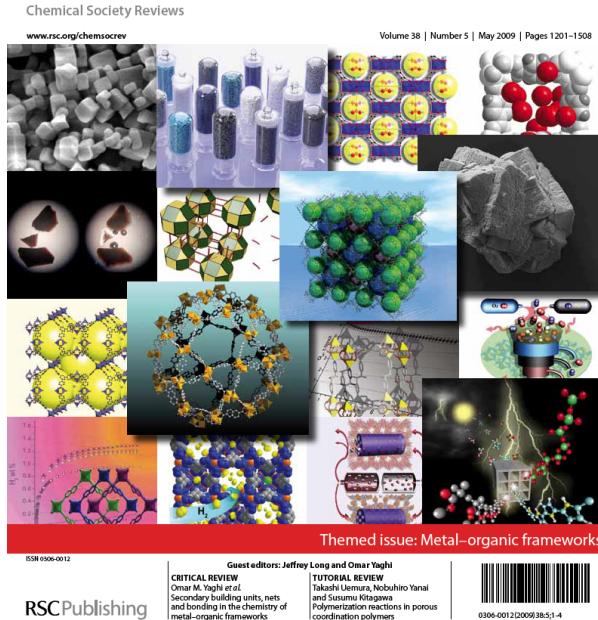

Cambridge Structural Database (1970-2010)

The Explosive Growth of Metal-Organic Frameworks

- The number of reported MOF structures has increased dramatically over the past 40 years
- The field of MOF chemistry has already warranted several thematic journal issues:

Chemical Society Reviews 2009, Vol. 38, Iss. 5

Chem Soc Rev

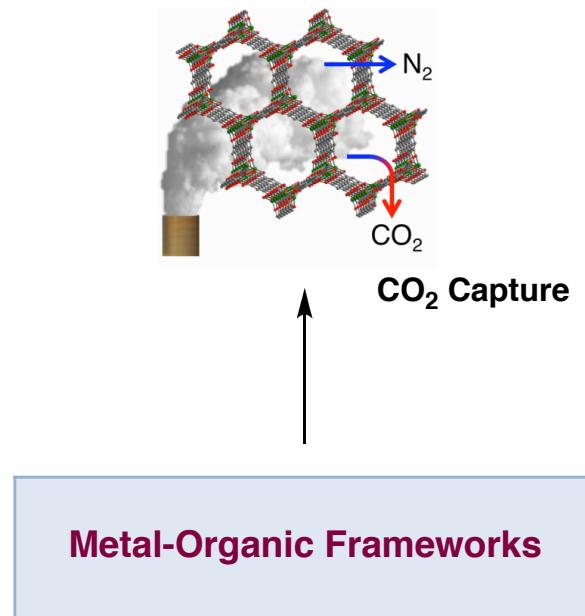

Chemical Reviews 2012, Vol. 112, Iss. 2

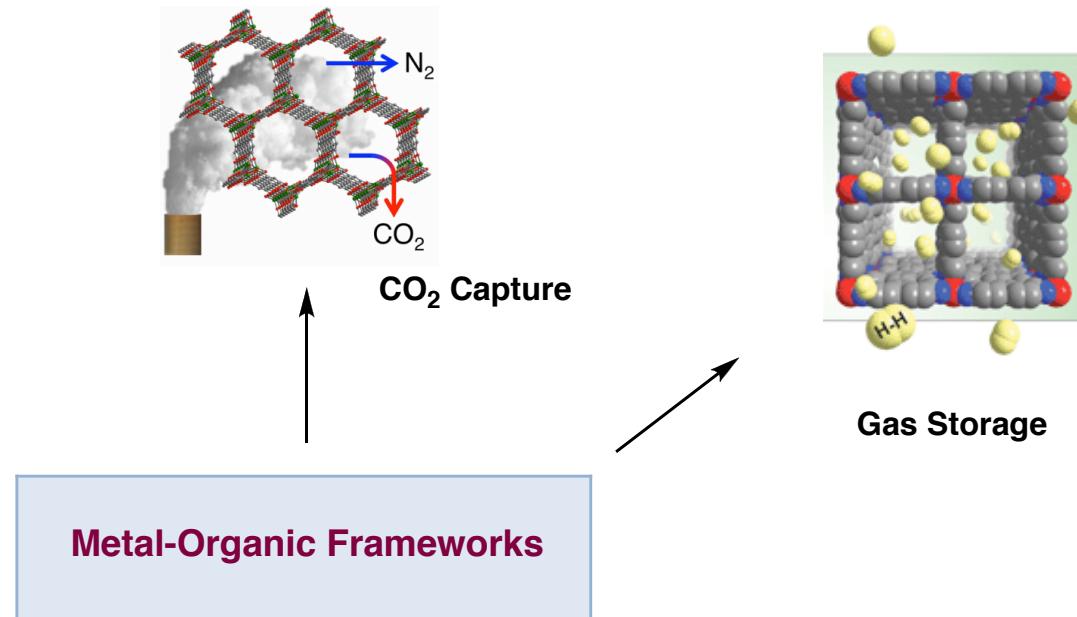

Applications of Metal-Organic Frameworks

Important Developments in MOF Scaffold Design

■ Yaghi and coworkers synthesized one of the first porous, crystalline, desolvated MOFs

- Incorporation of dicarboxylate linker caused a revolution in porous framework design
- Structure obtained through the coordination with Zn^{2+} ions in DMF
- Zn_4O SBUs serve as nodes to form 3D cubic scaffold **MOF-5**

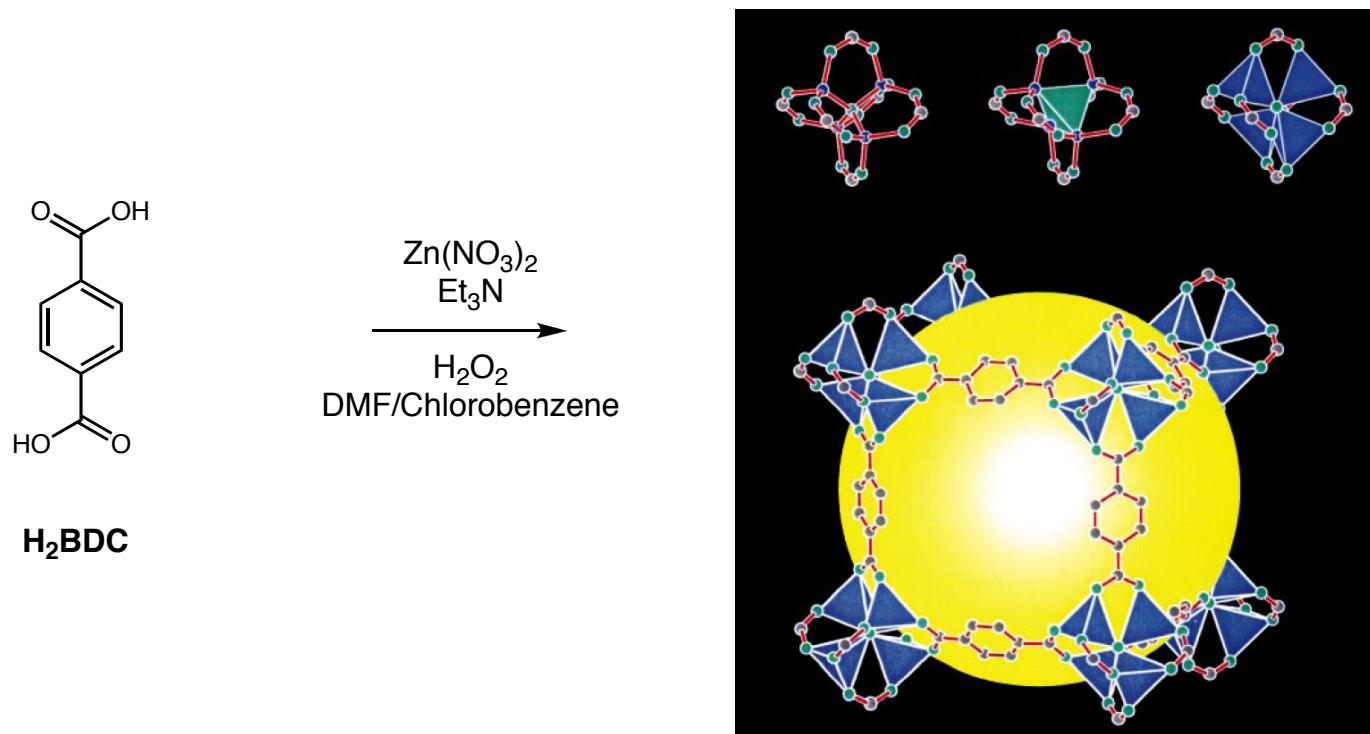

Li, H.; Eddaoudi, M.; O'Keefe, M.; Yaghi, O. M. *Nature* **1999**, *402*, 276-279.

Important Developments in MOF Scaffold Design

■ Yaghi and coworkers synthesized one of the first porous, crystalline, desolvated MOFs

- Incorporation of dicarboxylate linker caused a revolution in porous framework design
- Structure obtained through the coordination with Zn^{2+} ions in DMF
- Zn_4O SBUs serve as nodes to form 3D cubic scaffold **MOF-5**

Li, H.; Eddaoudi, M.; O'Keefe, M.; Yaghi, O. M. *Nature* **1999**, *402*, 276-279.

Important Developments in MOF Scaffold Design

■ Yaghi and coworkers synthesized one of the first porous, crystalline, desolvated MOFs

- Large and small cavities could accommodate substrates with width of 15.1 Å and 11.0 Å, respectively
- Channel aperture has width of 8.0 Å
- Solvent displacement (with CHCl₃) followed by vacuum, evacuates pores without losing stability
- Lowest recorded density of any crystalline material (**MOF-5** = 0.59 g/cm³)

Important Developments in MOF Scaffold Design

■ Yaghi and coworkers synthesized one of the first porous, crystalline, desolvated MOFs

- Large and small cavities could accommodate substrates with width of 15.1 Å and 11.0 Å, respectively
- Channel aperture has width of 8.0 Å
- Solvent displacement (with CHCl₃) followed by vacuum, evacuates pores without losing stability
- Lowest recorded density of any crystalline material (**MOF-5** = 0.59 g/cm³)

Desolvated stability of **MOF-5** has important applications in gas adsorption

Set the groundwork for a large number of catalytic MOF scaffolds

What are the Advantages to MOF Catalysis?

- MOFs combine the benefits of both heterogeneous and homogeneous catalysis

Heterogeneous Catalysis

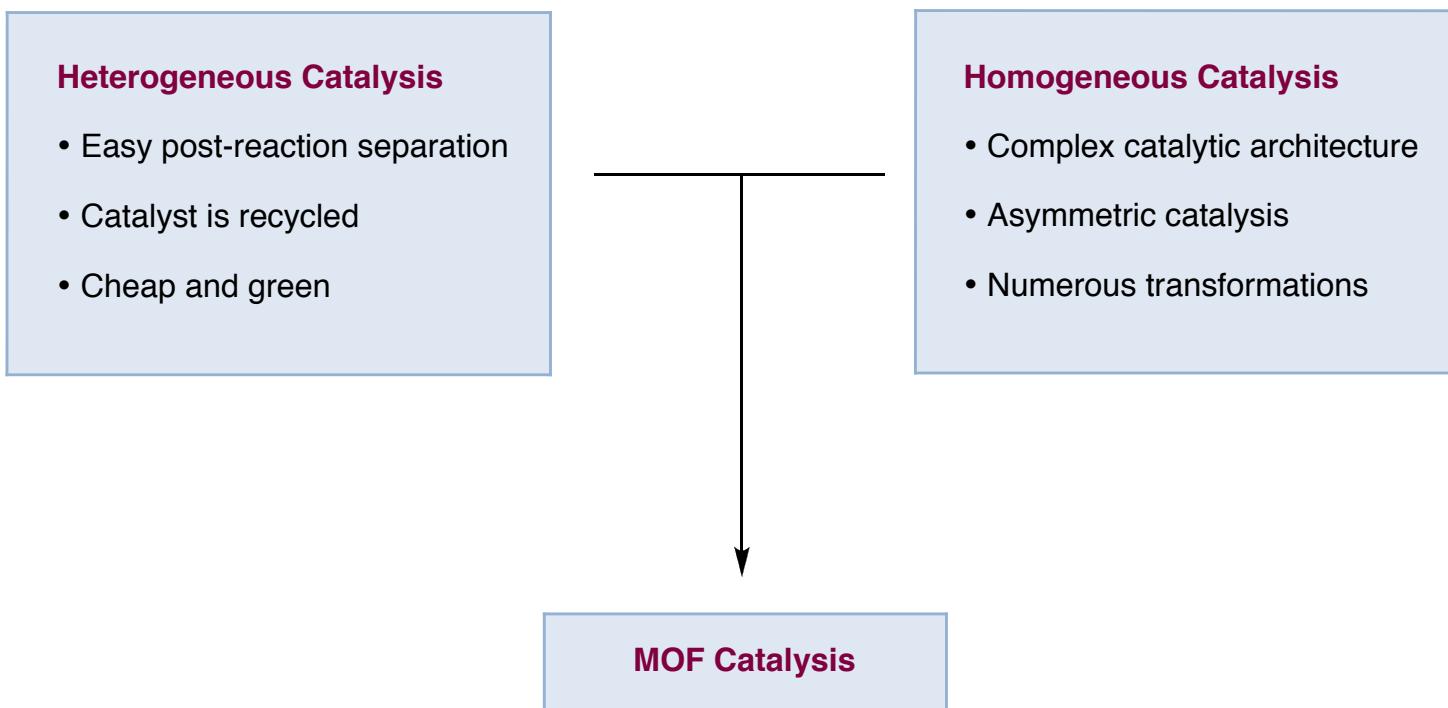

- Easy post-reaction separation
- Catalyst is recycled
- Cheap and green

Homogeneous Catalysis

- Complex catalytic architecture
- Asymmetric catalysis
- Numerous transformations

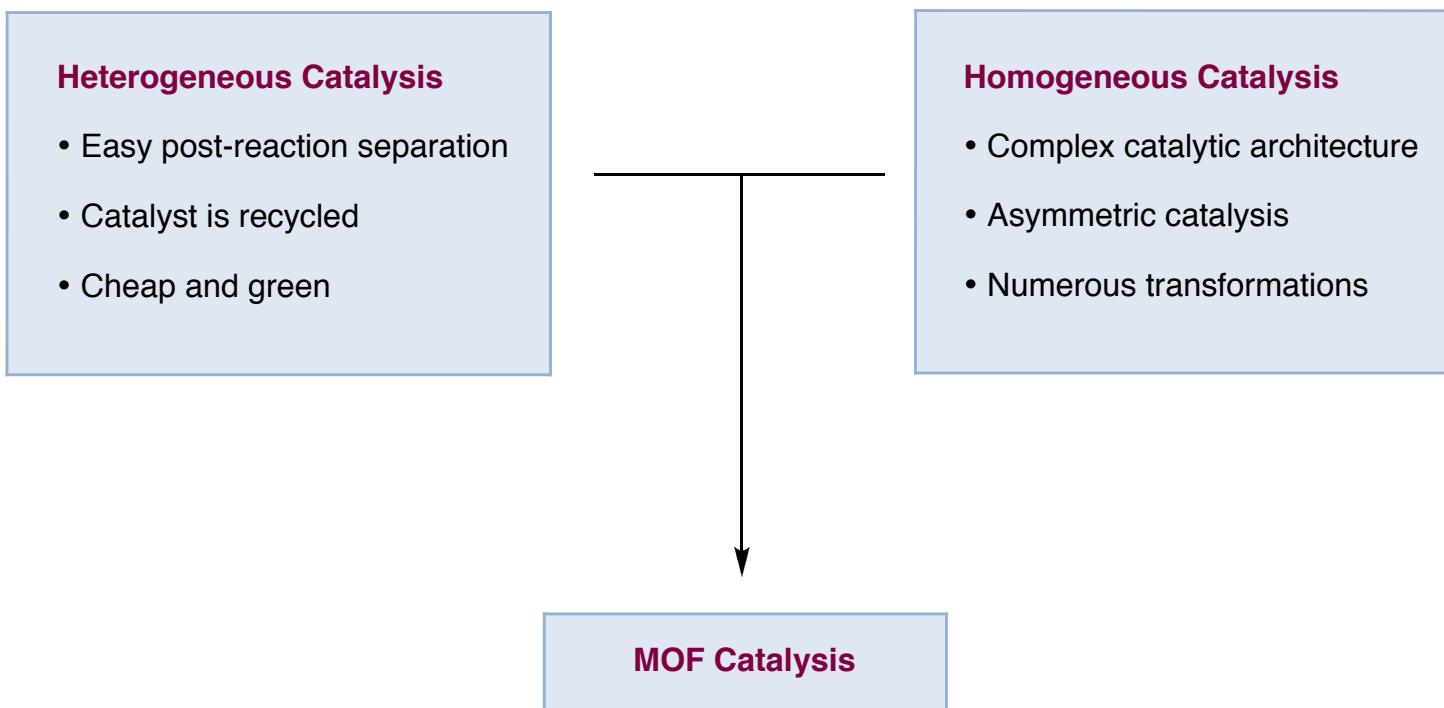

What are the Advantages to MOF Catalysis?

- MOFs combine the benefits of both heterogeneous and homogeneous catalysis

What are the Advantages to MOF Catalysis?

- MOFs combine the benefits of both heterogeneous and homogeneous catalysis

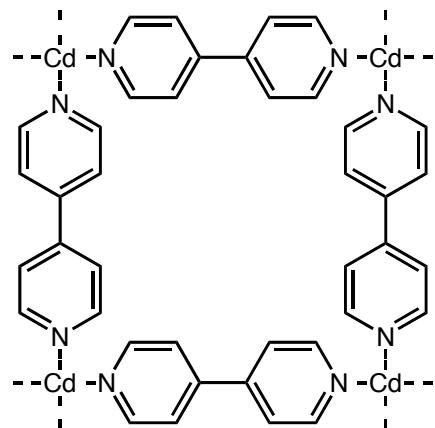

Can further advantages be obtained from combining these two catalytic approaches?

Early Reports of Metal-Organic Framework Catalysis

■ First report of MOF catalysis by Fujita and coworkers in 1994

- Combining Cd(NO₃)₂ and (4,4'-bpy) produced 2D network of Cd(4,4'-bpy)₂(NO₃)₂
- Each Cd(II) node has distorted octahedral geometry (nitrate ions occupy apical positions)
- Focused on clathration of aromatic guests with high shape specificity

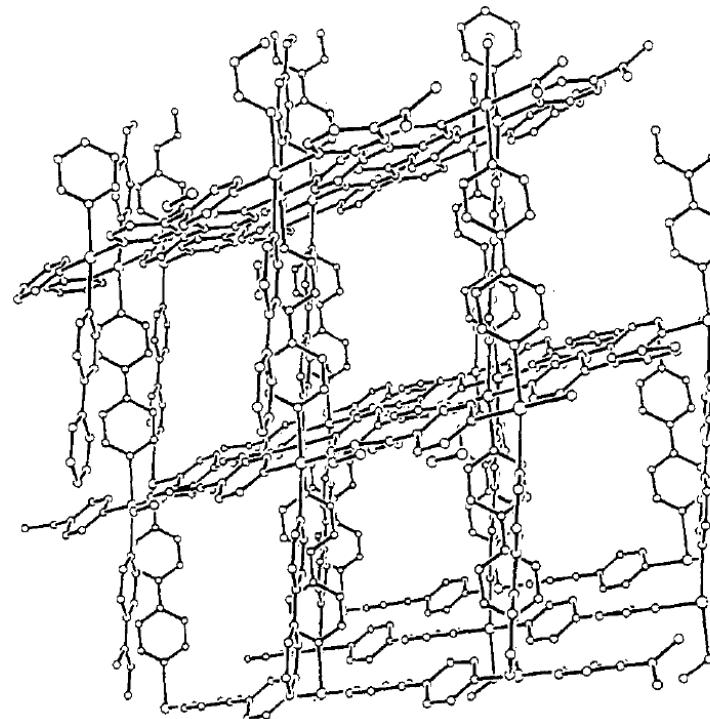

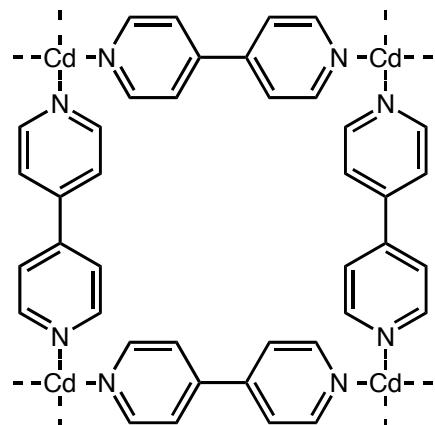

Fujita, M.; Kwon, Y. J.; Washizu, S.; Ogura, K. *J. Am. Chem. Soc.* **1994**, *116*, 1151-1152.

Early Reports of Metal-Organic Framework Catalysis

■ First report of MOF catalysis by Fujita and coworkers in 1994

- Combining Cd(NO₃)₂ and (4,4'-bpy) produced 2D network of Cd(4,4'-bpy)₂(NO₃)₂
- Each Cd(II) node has distorted octahedral geometry (nitrate ions occupy apical positions)
- Focused on clathration of aromatic guests with high shape specificity

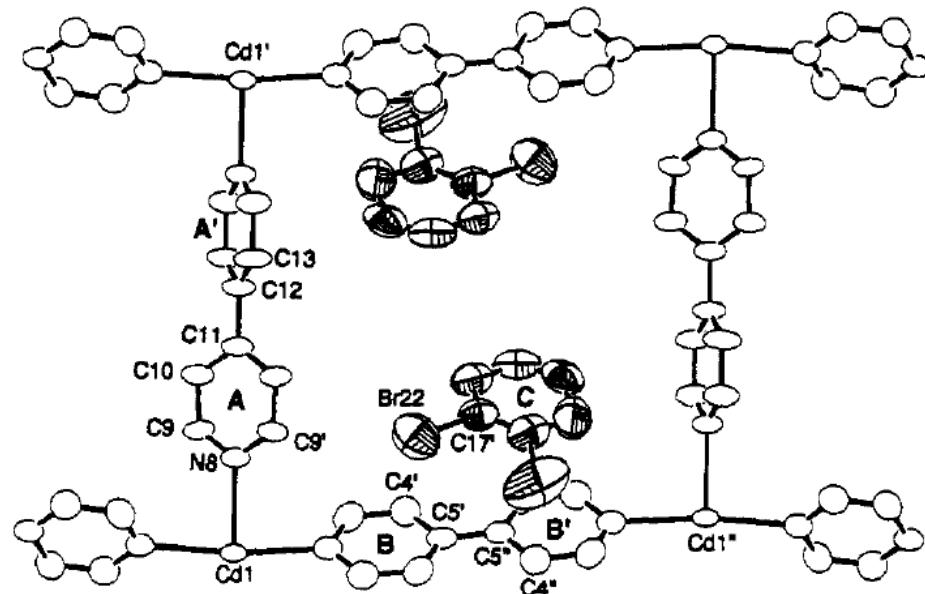

Fujita, M.; Kwon, Y. J.; Washizu, S.; Ogura, K. *J. Am. Chem. Soc.* **1994**, 116, 1151-1152.

Early Reports of Metal-Organic Framework Catalysis

■ First report of MOF catalysis by Fujita and coworkers in 1994

- Combining Cd(NO₃)₂ and (4,4'-bpy) produced 2D network of Cd(4,4'-bpy)₂(NO₃)₂
- Each Cd(II) node has distorted octahedral geometry (nitrate ions occupy apical positions)
- Focused on clathration of aromatic guests with high shape specificity
- *o*-dibromobenzene is clathrated efficiently, but *meta* and *para* isomers are not

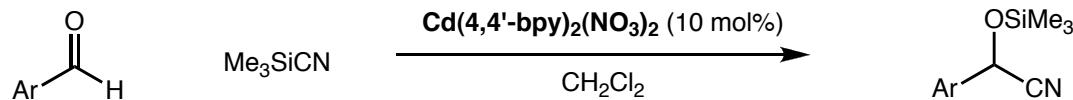

Fujita, M.; Kwon, Y. J.; Washizu, S.; Ogura, K. *J. Am. Chem. Soc.* **1994**, 116, 1151-1152.

Early Reports of Metal-Organic Framework Catalysis

■ First report of MOF catalysis by Fujita and coworkers in 1994

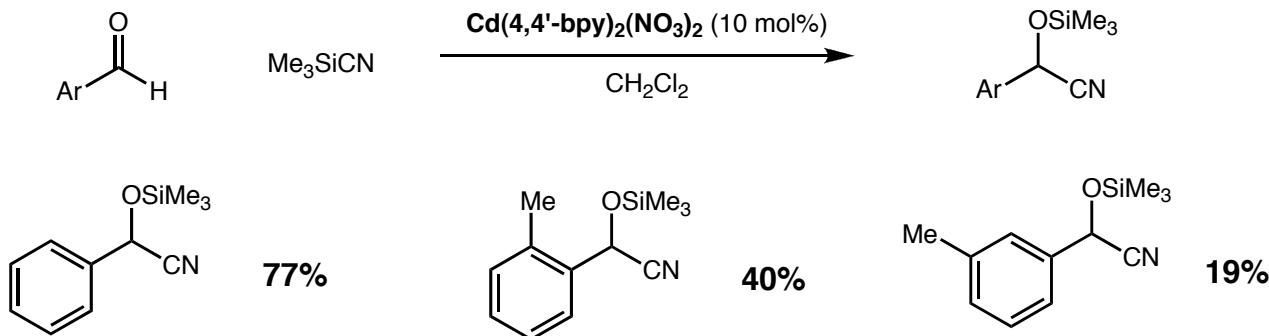

- $\text{Cd}(4,4'\text{-bpy})_2(\text{NO}_3)_2$ catalyzes the cyanosilylation of aldehydes
- $\text{Cd}(\text{NO}_3)_2$ or 4,4'-bpy alone do not catalyze the reaction
- Filtration of MOF shuts down reactivity = catalysis is heterogeneous

Early Reports of Metal-Organic Framework Catalysis

■ First report of MOF catalysis by Fujita and coworkers in 1994

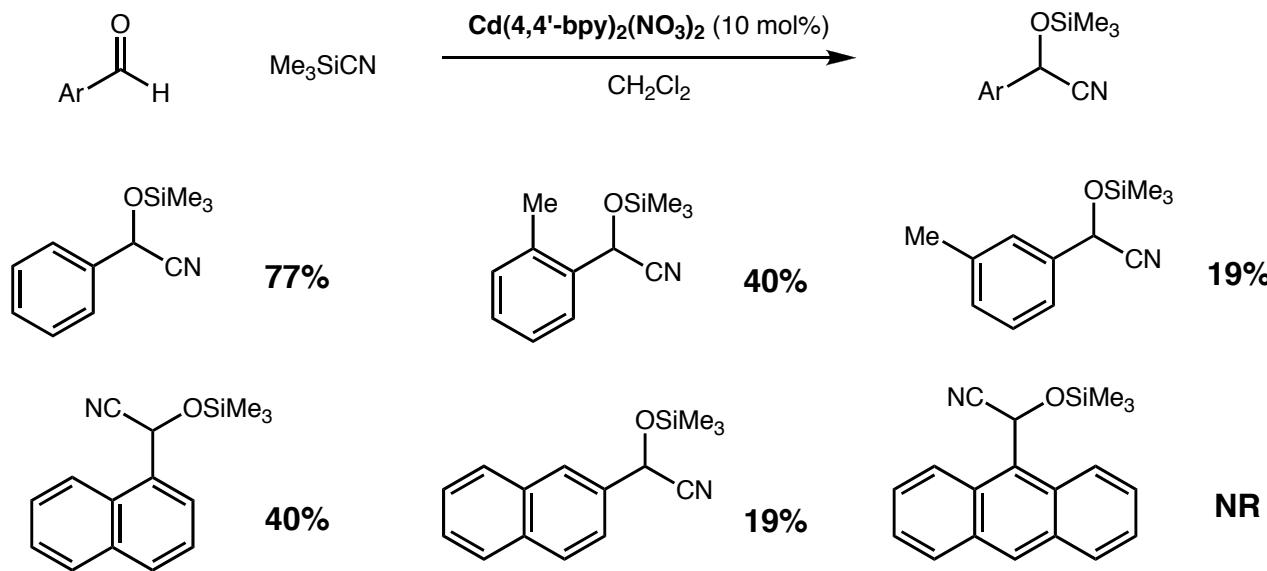

- $\text{Cd}(4,4'\text{-bpy})_2(\text{NO}_3)_2$ catalyzes the cyanosilylation of aldehydes
- $\text{Cd}(\text{NO}_3)_2$ or 4,4'-bpy alone do not catalyze the reaction
- Filtration of MOF shuts down reactivity = catalysis is heterogeneous

- Filtration of MOF shuts down reactivity = catalysis is heterogeneous

Early Reports of Metal-Organic Framework Catalysis

■ First report of MOF catalysis by Fujita and coworkers in 1994

- $\text{Cd}(4,4'\text{-bpy})_2(\text{NO}_3)_2$ catalyzes the cyanosilylation of aldehydes
- $\text{Cd}(\text{NO}_3)_2$ or 4,4'-bpy alone do not catalyze the reaction
- Filtration of MOF shuts down reactivity = catalysis is heterogeneous

Moderate substrate shape specificity attributed to cavity size of MOF scaffold

First Report of Metal-Organic Framework Asymmetric Catalysis

■ First report of asymmetric MOF catalysis by Kim and coworkers in 2000

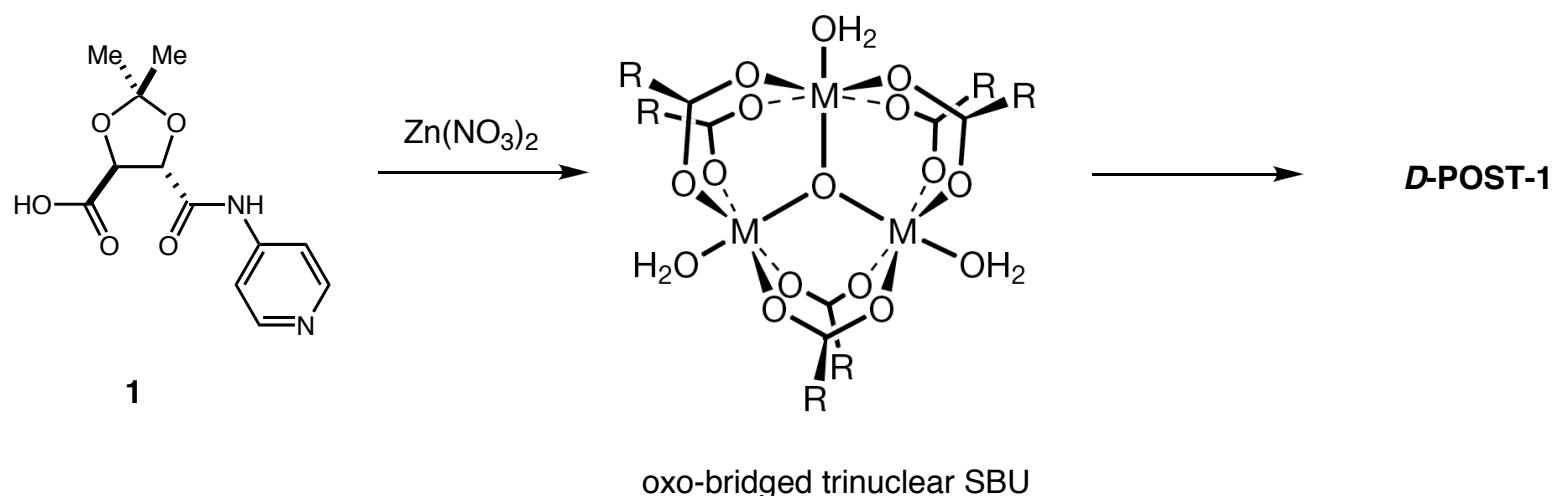

- Utilizes metal-organic clusters as secondary building units (SBUs)
- Oxo-bridged trinuclear Zn carboxylates assembled from linker **1** and Zn(NO₃)₂
- Homochiral framework **POST-1** (Pohang University of Science and Technology)

Seo, J. S.; Whang, D.; Lee, H.; Jun, S. I.; Oh, J.; Jeon, Y. J.; Kim, K. *Nature* **2000**, *404*, 982-986.

First Report of Metal-Organic Framework Asymmetric Catalysis

■ First report of asymmetric MOF catalysis by Kim and coworkers in 2000

- Utilizes metal-organic clusters as secondary building units (SBUs)
- Oxo-bridged trinuclear Zn carboxylates assembled from linker **1** and $Zn(NO_3)_2$
- Homochiral framework **POST-1** (Pohang University of Science and Technology)

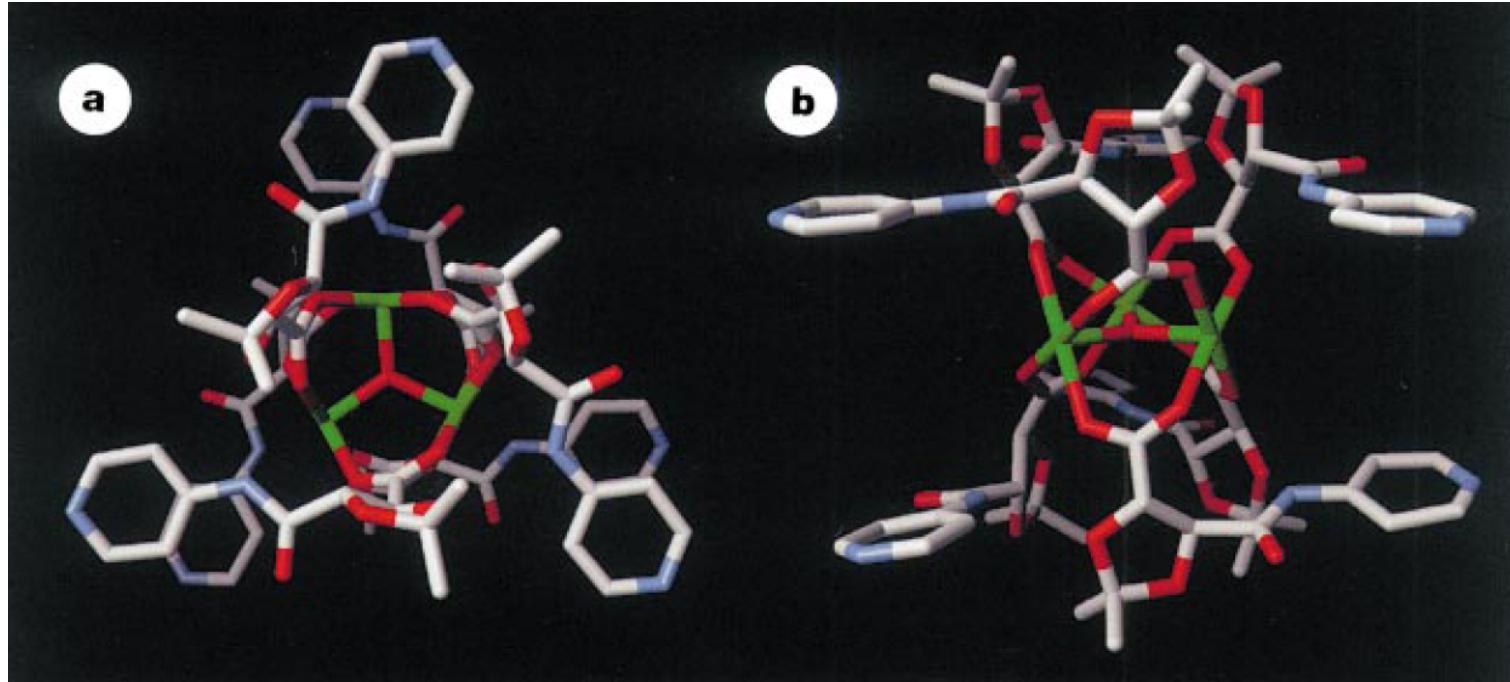

Seo, J. S.; Whang, D.; Lee, H.; Jun, S. I.; Oh, J.; Jeon, Y. J.; Kim, K. *Nature* **2000**, *404*, 982-986.

First Report of Metal-Organic Framework Asymmetric Catalysis

■ First report of asymmetric MOF catalysis by Kim and coworkers in 2000

- Utilizes metal-organic clusters as secondary building units (SBUs)
- Oxo-bridged trinuclear Zn carboxylates assembled from linker **1** and $\text{Zn}(\text{NO}_3)_2$
- Homochiral framework **POST-1** (Pohang University of Science and Technology)

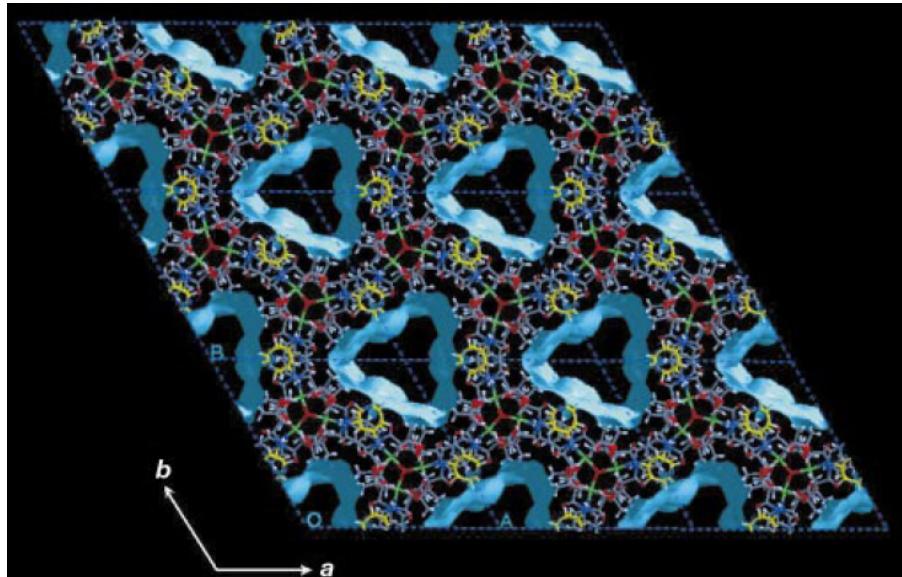

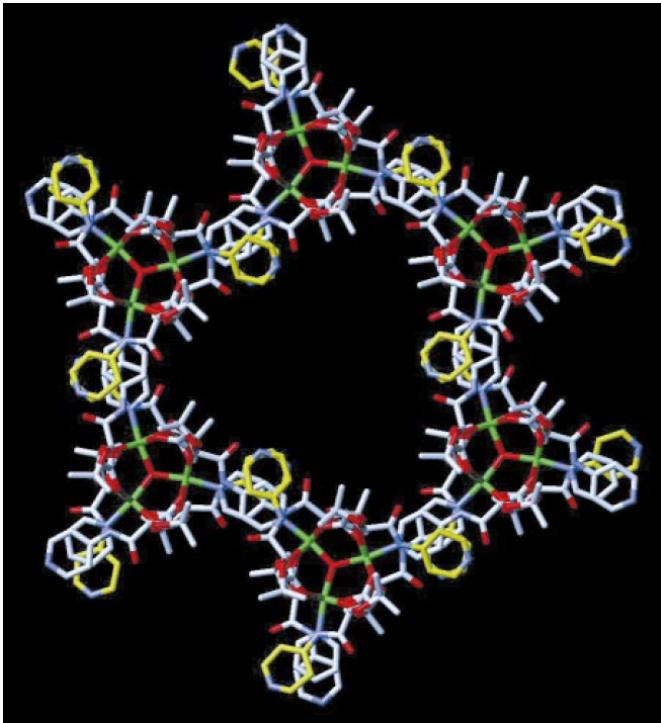

Seo, J. S.; Whang, D.; Lee, H.; Jun, S. I.; Oh, J.; Jeon, Y. J.; Kim, K. *Nature* **2000**, *404*, 982-986.

First Report of Metal-Organic Framework Asymmetric Catalysis

■ First report of asymmetric MOF catalysis by Kim and coworkers in 2000

- 3 of 6 pyridyl groups replace Zn-bound H₂O and connect SBUs in 2D network
- Remaining 3 pyridyl groups extend into pore with no framework interaction
- 2D layers stack to form large triangular chiral channels (~13 Å side length)

Seo, J. S.; Whang, D.; Lee, H.; Jun, S. I.; Oh, J.; Jeon, Y. J.; Kim, K. *Nature* **2000**, *404*, 982-986.

First Report of Metal-Organic Framework Asymmetric Catalysis

■ First report of asymmetric MOF catalysis by Kim and coworkers in 2000

- 2 of the 3 channel pyridyl groups are protonated to conserve charge neutrality
- Protons can be exchanged for metal ions (Na^+ , K^+ , Rb^+) or converted to *N*-alkyl pyridinium ions
- First example of enantioselective inclusion of chiral metal complexes into porous materials:

Ru(bpy)_3^{2+} can be bound with 66% ee in favor of the Δ form

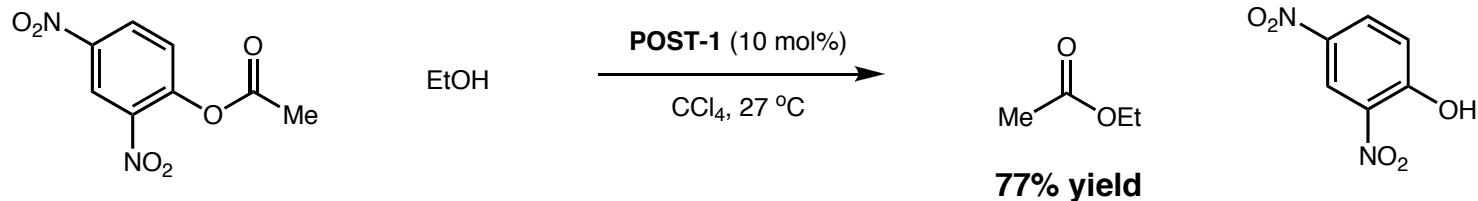

First Report of Metal-Organic Framework Asymmetric Catalysis

■ First report of asymmetric MOF catalysis by Kim and coworkers in 2000

- 2 of the 3 channel pyridyl groups are protonated to conserve charge neutrality
- Protons can be exchanged for metal ions (Na^+ , K^+ , Rb^+) or converted to *N*-alkyl pyridinium ions
- First example of enantioselective inclusion of chiral metal complexes into porous materials:

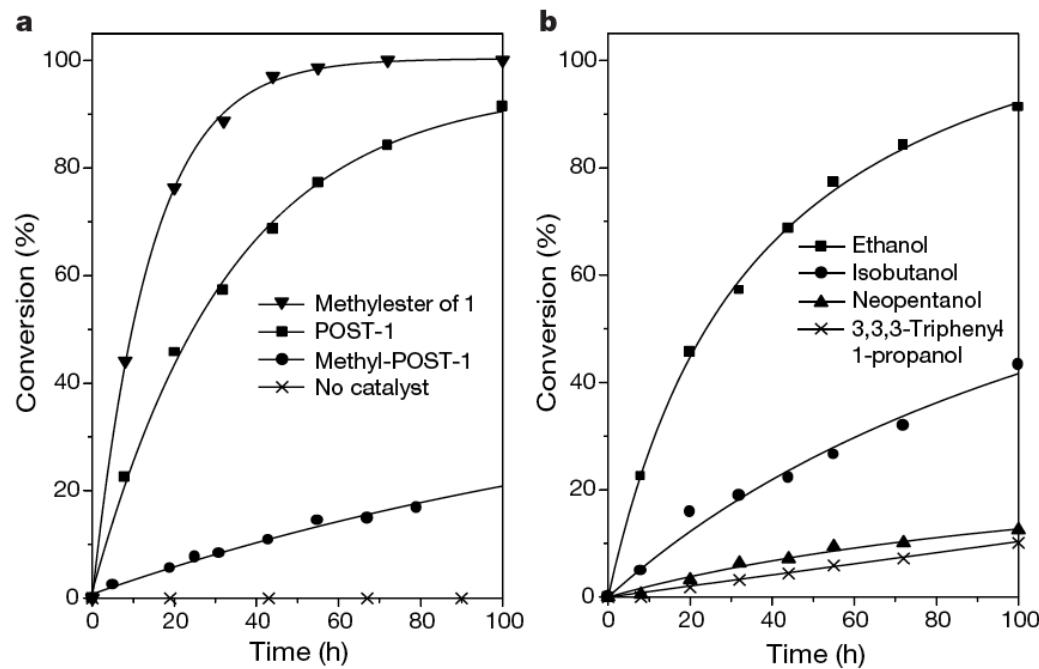

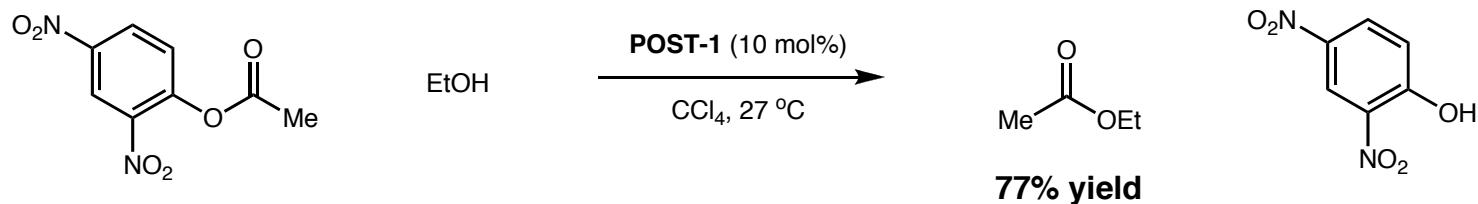

Ru(bpy)_3^{2+} can be bound with 66% ee in favor of the Δ form

- POST-1 is competent transesterification catalyst

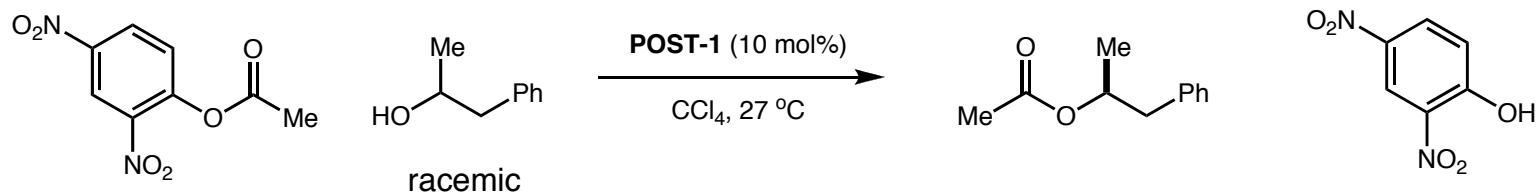

First Report of Metal-Organic Framework Asymmetric Catalysis

■ First report of asymmetric MOF catalysis by Kim and coworkers in 2000

First Report of Metal-Organic Framework Asymmetric Catalysis

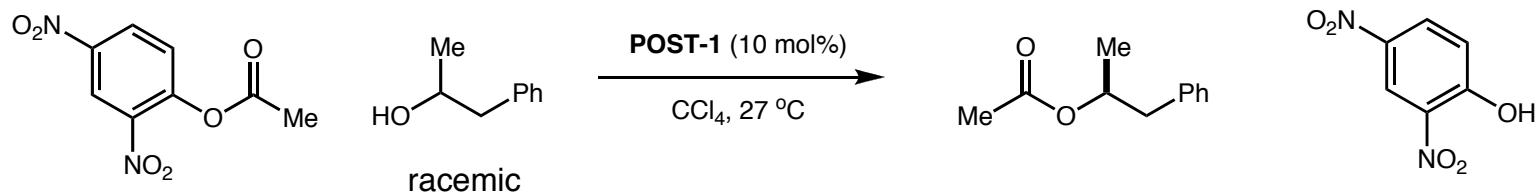

■ First report of asymmetric MOF catalysis by Kim and coworkers in 2000

Catalyst	<i>S</i> (%)	<i>R</i> (%)	ee (%)
<i>L</i> -POST-1 (<i>R,R</i>)	45.9	54.1	8.2
<i>D</i> -POST-1 (<i>S,S</i>)	54.2	45.9	8.3
Pyridine	49.6	50.5	0.9

First Report of Metal-Organic Framework Asymmetric Catalysis

■ First report of asymmetric MOF catalysis by Kim and coworkers in 2000

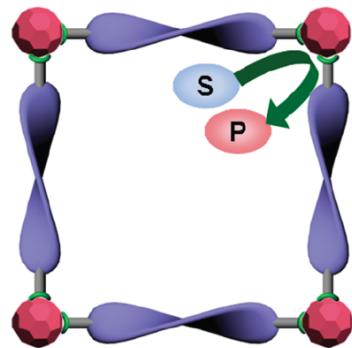

Catalyst	<i>S</i> (%)	<i>R</i> (%)	ee (%)

Pyridine	49.6	50.5	0.9

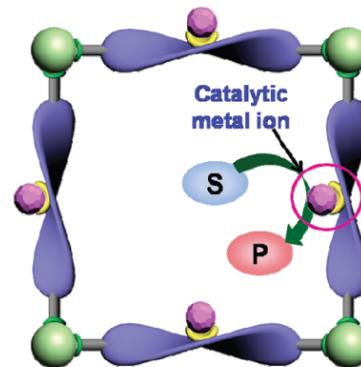

8% enantiomeric excess produced through transesterification catalyzed by homochiral MOF
First observation of asymmetric induction mediated by a porous metal-organic framework

Diverse Strategies for Metal-Organic Framework Catalysis

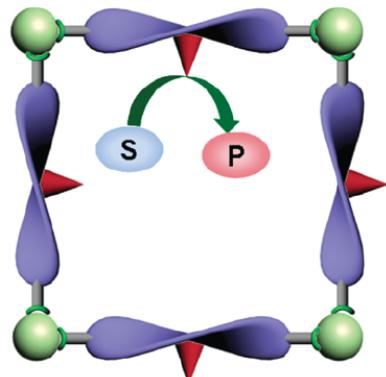

■ Metal node catalysis

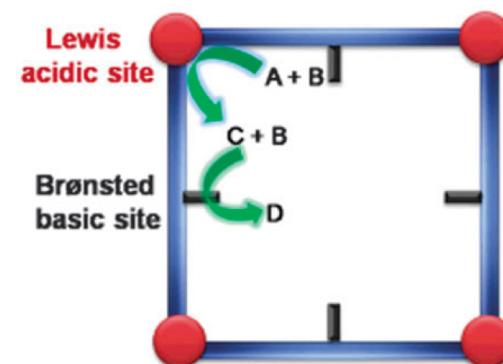

■ Privileged metal catalyst

■ Organocatalytic linkers

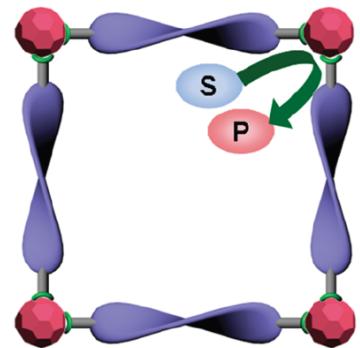

■ Multifunctional catalysis

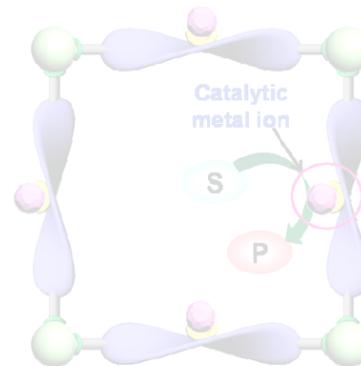

Diverse Strategies for Metal-Organic Framework Catalysis

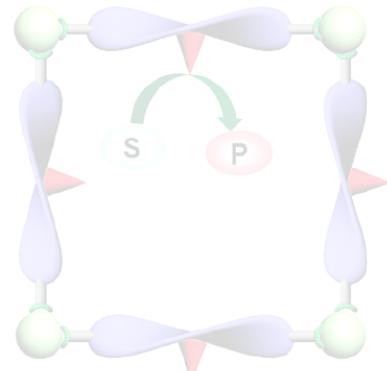

■ Metal node catalysis

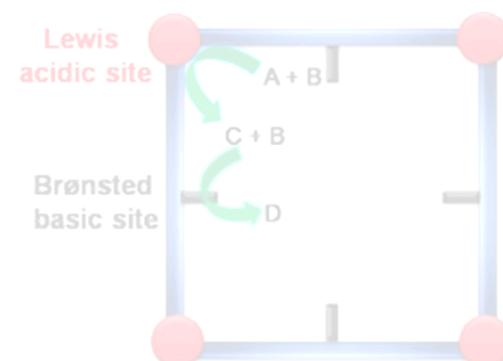

■ Privileged metal catalyst

■ Organocatalytic linkers

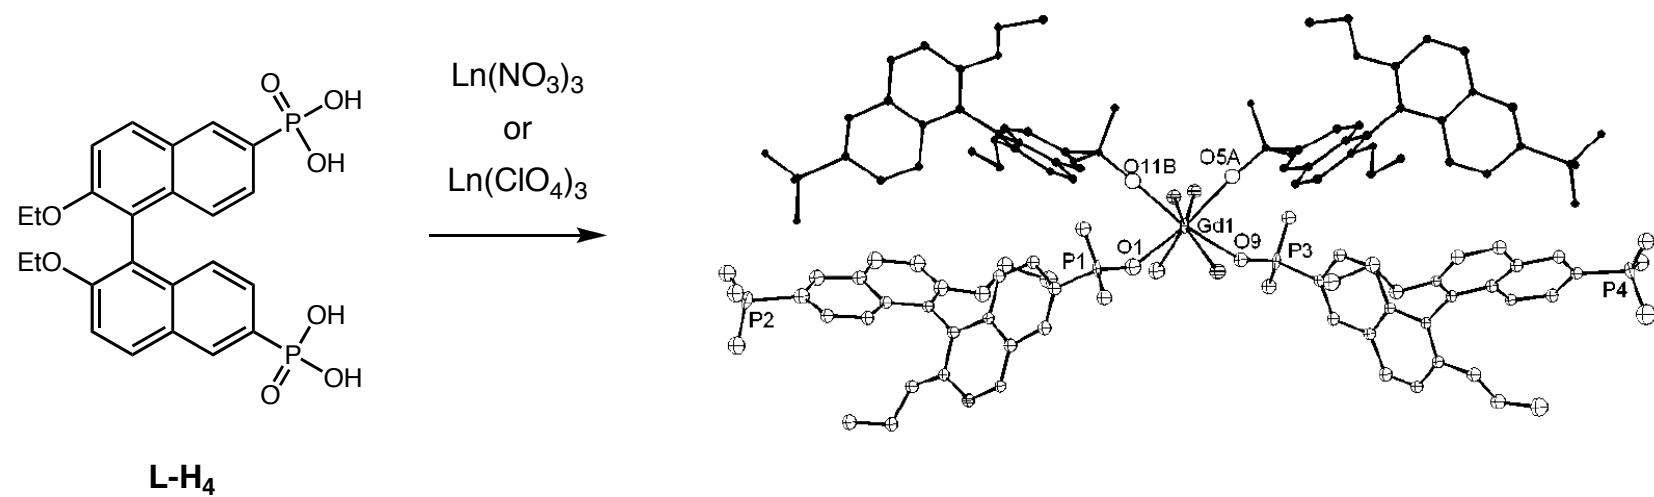

■ Multifunctional catalysis

Metal Node Catalysis - Lanthanide Phosphonates

■ Homochiral Ln^{3+} (bisphosphonates) represent early foray into asymmetric metal node catalysis

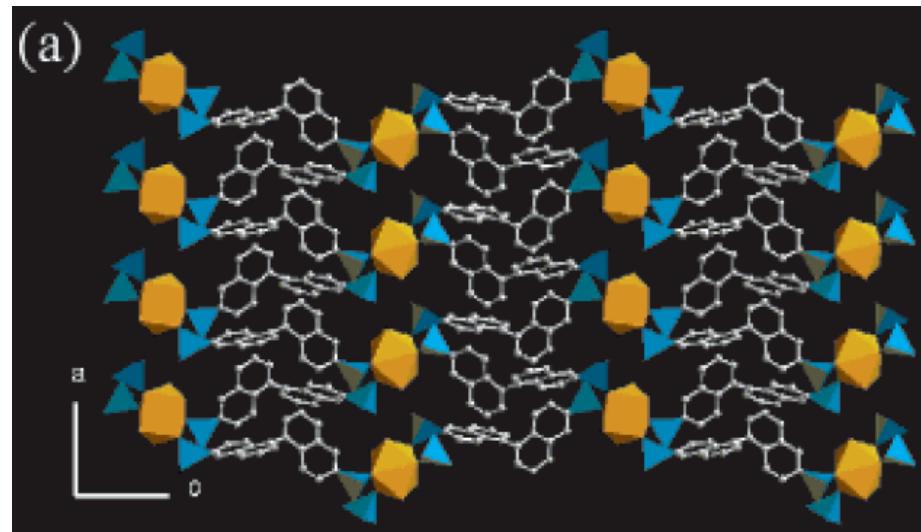

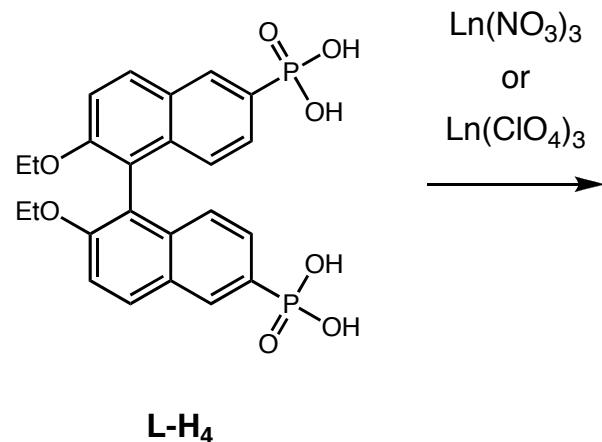

- Porous, lamellar structure contains two phosphonate ligands (**L-H₂** and **L-H₃**)
- Series of MOFs synthesized with various lanthanides (La, Ce, Pr, Nd, Sm, Gd, Tb)
- MOFs comprised of general formula: $[\text{Ln}(\text{L-H}_2)(\text{L-H}_3)(\text{H}_2\text{O})_4] \bullet x\text{H}_2\text{O}$

Metal Node Catalysis - Lanthanide Phosphonates

■ Homochiral Ln^{3+} (bisphosphonates) represent early foray into asymmetric metal node catalysis

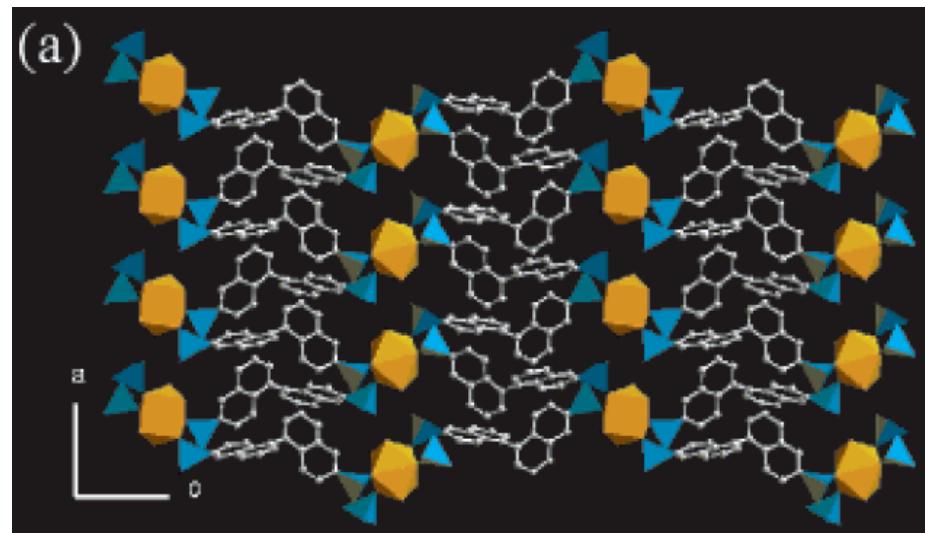

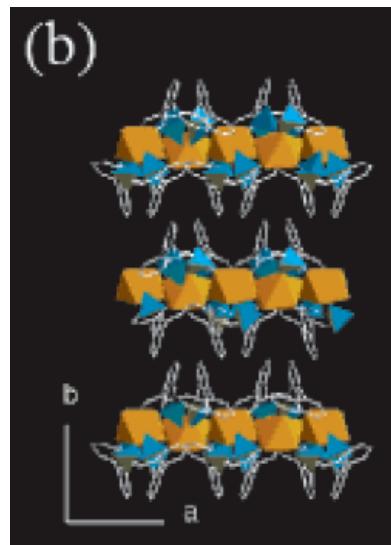

- Porous, lamellar structure contains two phosphonate ligands (**L-H₂** and **L-H₃**)
- Series of MOFs synthesized with various lanthanides (La, Ce, Pr, Nd, Sm, Gd, Tb)
- MOFs comprised of general formula: $[\text{Ln}(\text{L-H}_2)(\text{L-H}_3)(\text{H}_2\text{O})_4] \cdot x\text{H}_2\text{O}$

Metal Node Catalysis - Lanthanide Phosphonates

■ Homochiral Ln^{3+} (bisphosphonates) represent early foray into asymmetric metal node catalysis

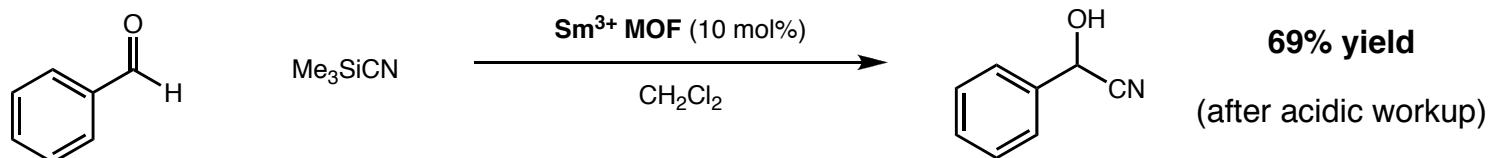

- Porous, lamellar structure contains two phosphonate ligands (**L-H₂** and **L-H₃**)
- Series of MOFs synthesized with various lanthanides (La, Ce, Pr, Nd, Sm, Gd, Tb)
- MOFs comprised of general formula: $[\text{Ln}(\text{L-H}_2)(\text{L-H}_3)(\text{H}_2\text{O})_4] \bullet x\text{H}_2\text{O}$

Metal Node Catalysis - Lanthanide Phosphonates

■ Homochiral Ln^{3+} (bisphosphonates) represent early foray into asymmetric metal node catalysis

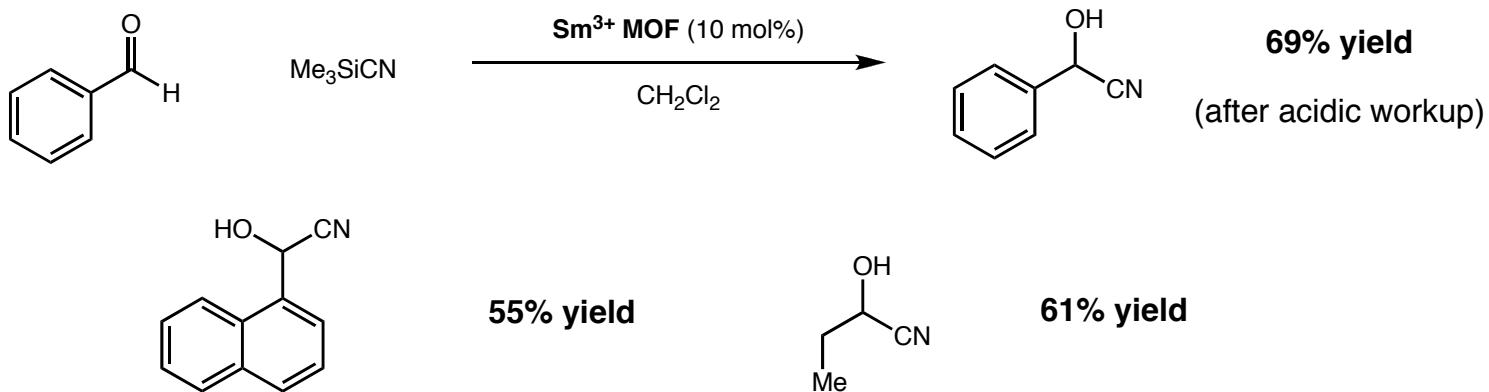

- Asymmetric channels around nodes ($\sim 12 \text{ \AA}$)
- Possesses both Lewis and Brønsted acid sites
- Catalyzes the cyanosilylation of aldehydes

Metal Node Catalysis - Lanthanide Phosphonates

■ Homochiral Ln^{3+} (bisphosphonates) represent early foray into asymmetric metal node catalysis

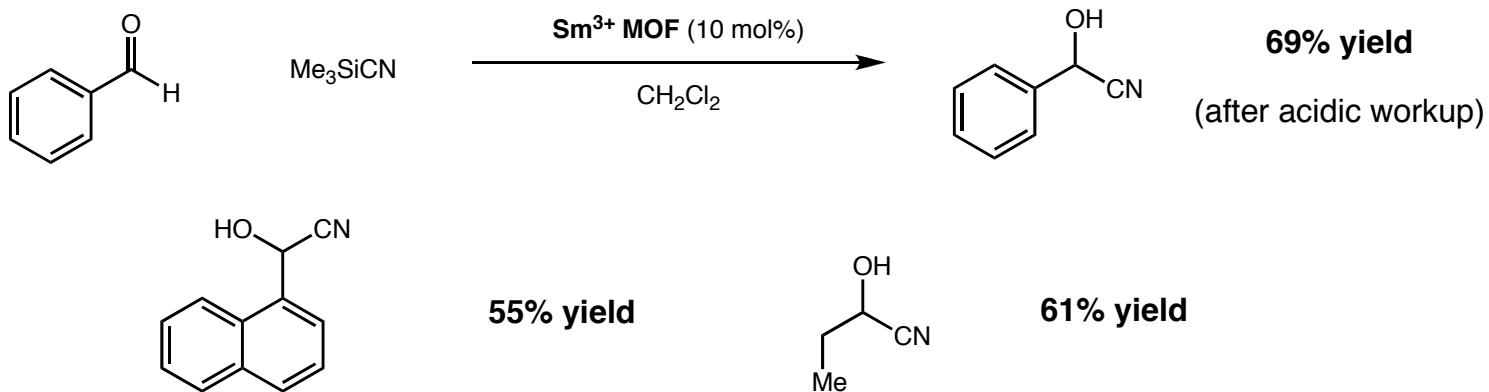

- Asymmetric channels around nodes ($\sim 12 \text{ \AA}$)
- Possesses both Lewis and Brønsted acid sites
- Catalyzes the cyanosilylation of aldehydes

Metal Node Catalysis - Lanthanide Phosphonates

■ Homochiral Ln^{3+} (bisphosphonates) represent early foray into asymmetric metal node catalysis

- Asymmetric channels around nodes ($\sim 12 \text{ \AA}$)
- Possesses both Lewis and Brønsted acid sites
- Catalyzes the cyanosilylation of aldehydes

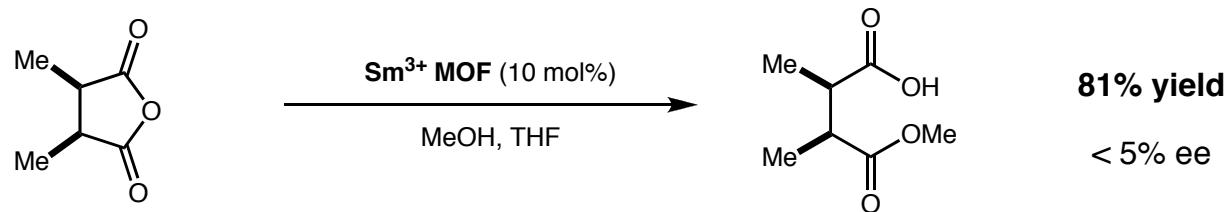

- Indiscrimination between substrates suggests MOF pores swell to accommodate larger aldehydes
- All three products were racemic (< 5% ee)

Metal Node Catalysis - Lanthanide Phosphonates

■ Homochiral Ln^{3+} (bisphosphonates) represent early foray into asymmetric metal node catalysis

- Lewis acid promoted ring opening of *meso*-anhydrides catalyzed by Sm^{3+} MOF

- Both cyanosilylation and ring opening are heterogeneous (reactivity ceases after filtration of MOF)
- Catalyst can be recycled multiple times with no loss in reactivity

Metal Node Catalysis - Lanthanide Phosphonates

■ Homochiral Ln^{3+} (bisphosphonates) represent early foray into asymmetric metal node catalysis

- Lewis acid promoted ring opening of *meso*-anhydrides catalyzed by Sm^{3+} MOF

- Both cyanosilylation and ring opening are heterogeneous (reactivity ceases after filtration of MOF)
- Catalyst can be recycled multiple times with no loss in reactivity

■ *R*-Sm(III)(bisphosphonate) enables enantioselective separations

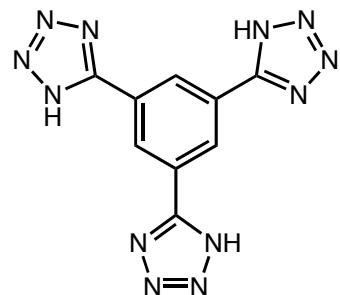

Evans, O. R.; Ngo, H. L.; Lin, W. *J. Am. Chem. Soc.* **2001**, 123, 10395-10396.

Metal Node Catalysis - Mn²⁺ Nodes

■ Long and coworkers showed unsaturated Mn²⁺ nodes in MOFs act as Lewis acid catalysts

- Efforts to improve H₂ adsorption have resulted in numerous MOFs with coordinatively unsaturated metal nodes
- Application as Lewis acidic sites has proven successful
- Mn₃[(Mn₄Cl)₃(BTT)₈(MeOH)₁₀]₂ contains exposed Mn²⁺ nodes within pores and on surface

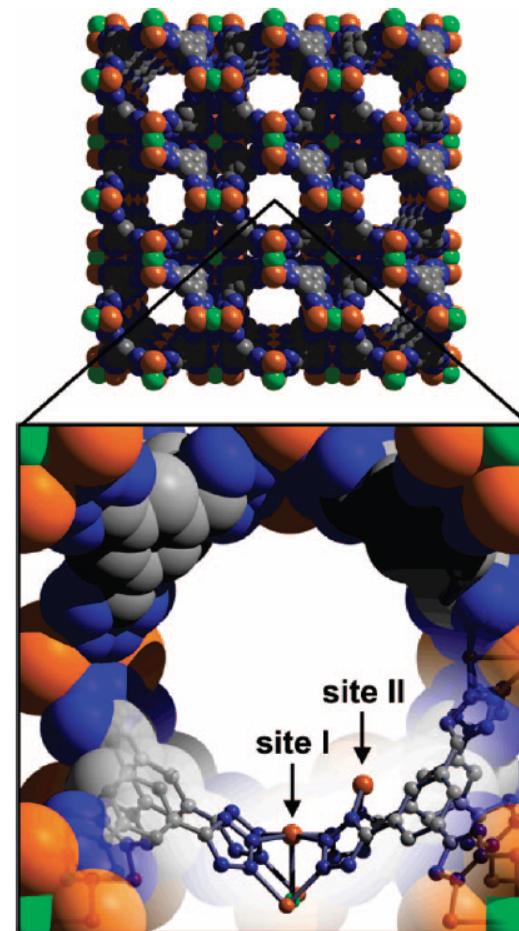

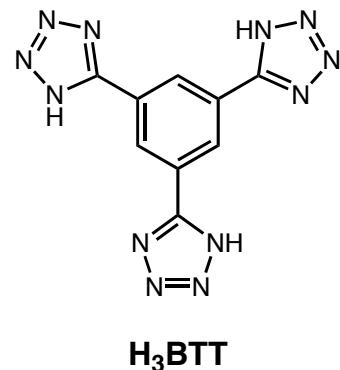

H₃BTT

Metal Node Catalysis - Mn^{2+} Nodes

■ Long and coworkers showed unsaturated Mn^{2+} nodes in MOFs act as Lewis acid catalysts

- Efforts to improve H_2 adsorption have resulted in numerous MOFs with coordinatively unsaturated metal nodes
- Application as Lewis acidic sites has proven successful
- $Mn_3[(Mn_4Cl)_3(BTT)_8(MeOH)_{10}]_2$ contains exposed Mn^{2+} nodes within pores and on surface

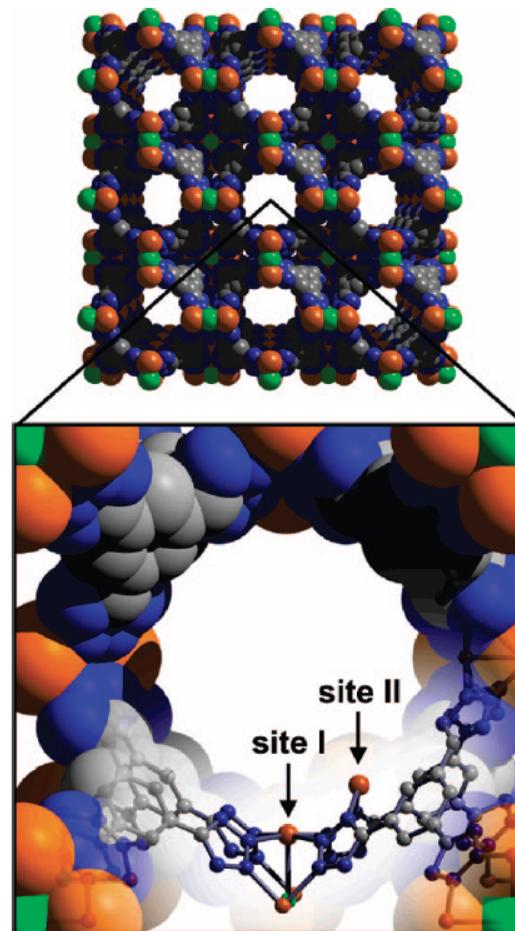

Horike, S.; Dinca, N.; Tamaki, K.; Long, J. R. *J. Am. Chem. Soc.* **2008**, 130, 5854-5855.

Metal Node Catalysis - Mn^{2+} Nodes

■ Long and coworkers showed unsaturated Mn^{2+} nodes in MOFs act as Lewis acid catalysts

- Efforts to improve H_2 adsorption have resulted in numerous MOFs with coordinatively unsaturated metal nodes
- Application as Lewis acidic sites has proven successful
- $Mn_3[(Mn_4Cl)_3(BTT)_8(MeOH)_{10}]_2$ contains exposed Mn^{2+} nodes within pores and on surface

- Site I = five-coordinate Mn^{2+}
- Site II = two-coordinate Mn^{2+}
- Both sites positioned to interact with substrate
- 10 Å-wide channel, accessible pore

Metal Node Catalysis - Mn²⁺ Nodes

■ Mn²⁺ nodes catalyse the cyanosilylation of aromatic ketones and aldehydes

- Convenient route to cyanohydrin products
- Significant improvement in yield relative to pioneering work by Lin in 2001 (Ln bisphosphonates)

entry	Ar	R	time (h)	yield (%) ^b
1	phenyl	H	9	98
2	1-naphthyl	H	9	90
3	4-phenoxyphenyl	H	9	19
4	biphenyl	H	9	18
5	phenyl	CH ₃	24	28
6	biphenyl	CH ₃	24	1

Metal Node Catalysis - Mn^{2+} Nodes

■ Mn^{2+} nodes catalyse the cyanosilylation of aromatic ketones and aldehydes

- Convenient route to cyanohydrin products
- Significant improvement in yield relative to pioneering work by Lin in 2001 (Ln bisphosphonates)

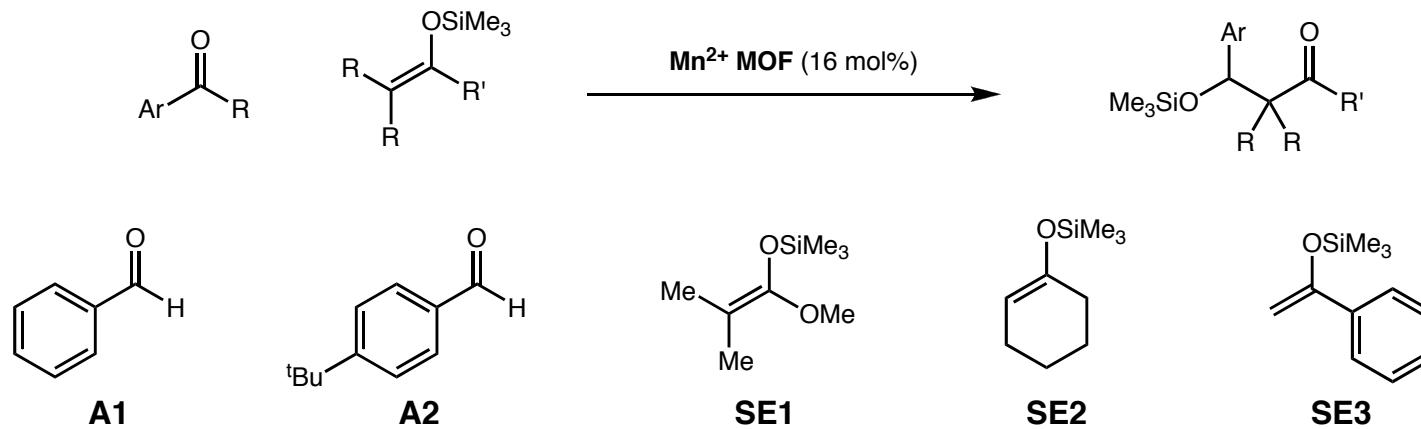

entry	Ar	R	time (h)	yield (%) ^b
1	phenyl	H	9	98
2	1-naphthyl	H	9	90
3	4-phenoxyphenyl	H	9	19
4	biphenyl	H	9	18
5	phenyl	CH ₃	24	28
6	biphenyl	CH ₃	24	1

- Filtration of catalyst after 4 h shuts down reactivity = catalyst is heterogeneous in nature
- IR C–O stretches of 1698 cm⁻¹ and 1686 cm⁻¹ show benzaldehyde is coordinated by Mn^{2+}
- Significant substrate size selectivity is observed - **one of the first examples in MOF catalysis**

Metal Node Catalysis - Mn²⁺ Nodes

■ Mn²⁺ nodes also catalyse the Mukaiyama-Aldol reaction

- Despite this transformation typically requiring stronger Lewis Acids, the Mn²⁺ nodes are competent

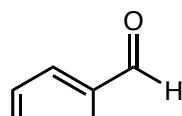

entry	aldehyde	silyl enolate	time (h)	solvent	yield (%) ^b
1	A1	SE1	99	CH ₂ Cl ₂	63
2	A2	SE1	99	CH ₂ Cl ₂	24
3	A1	SE2	99	CH ₂ Cl ₂	<1
4	A1	SE3	99	CH ₂ Cl ₂	<1
5 ^c	A1	SE1	6	DMF	8 ^d
6 ^c	A1	SE1	6	DMF	51

^c Run at -45 °C. ^d No catalyst added.

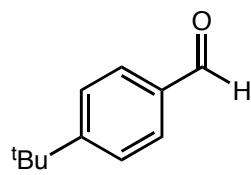

Metal Node Catalysis - Mn^{2+} Nodes

■ Mn^{2+} nodes also catalyse the Mukaiyama-Aldol reaction

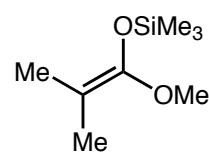

- Surprisingly DMF improved reactivity despite being a highly coordinating solvent
- In CH_2Cl_2 , only 16% yield after 6 h with A1 and SE1
- DMF may activate silyl enolate through coordination with Si–O bond
- Mn^{2+} nodes and DMF may act synergistically to activate both coupling partners independently

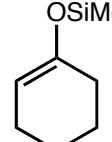

A1

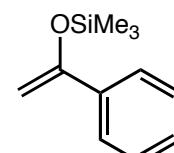

A2

SE1

SE2

SE3

entry	aldehyde	silyl enolate	time (h)	solvent	yield (%) ^b
1	A1	SE1	99	CH_2Cl_2	63
2	A2	SE1	99	CH_2Cl_2	24
3	A1	SE2	99	CH_2Cl_2	<1
4	A1	SE3	99	CH_2Cl_2	<1
5 ^c	A1	SE1	6	DMF	8 ^d
6 ^c	A1	SE1	6	DMF	51

^c Run at $-45\text{ }^{\circ}\text{C}$. ^d No catalyst added.

Metal Node Catalysis - Mn²⁺ Nodes

■ Mn²⁺ nodes also catalyse the Mukaiyama-Aldol reaction

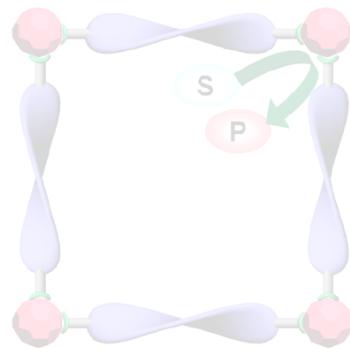

- Surprisingly DMF improved reactivity despite being a highly coordinating solvent
- In CH₂Cl₂, only 16% yield after 6 h with A1 and SE1
- DMF may activate silyl enolate through coordination with Si–O bond
- Mn²⁺ nodes and DMF may act synergistically to activate both coupling partners independently

MOF containing Mn²⁺ functions as effective Lewis acid catalyst

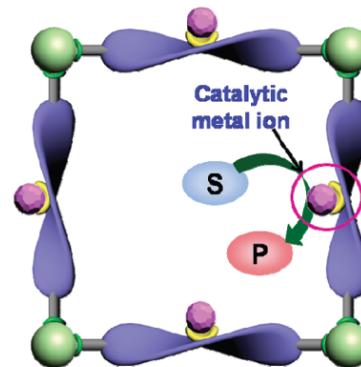

- Both cyanosilylation of carbonyls and Mukaiyama-Aldol reaction achieved
- Pore dimensions control substrate reactivity based on size
- Metal node catalysis is a reliable activation method, maintains MOF structure and porosity

Diverse Strategies for Metal-Organic Framework Catalysis

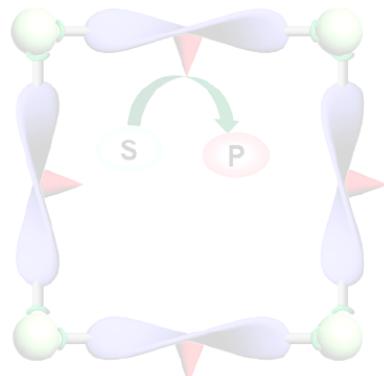

■ Metal node catalysis

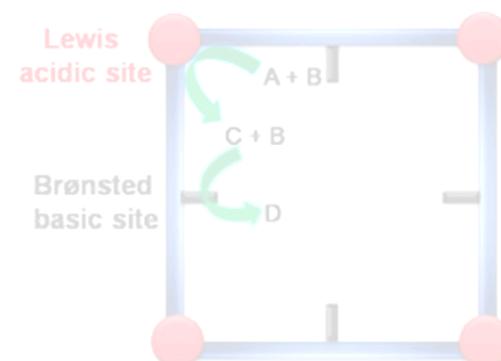

■ Privileged metal catalyst

■ Organocatalytic linkers

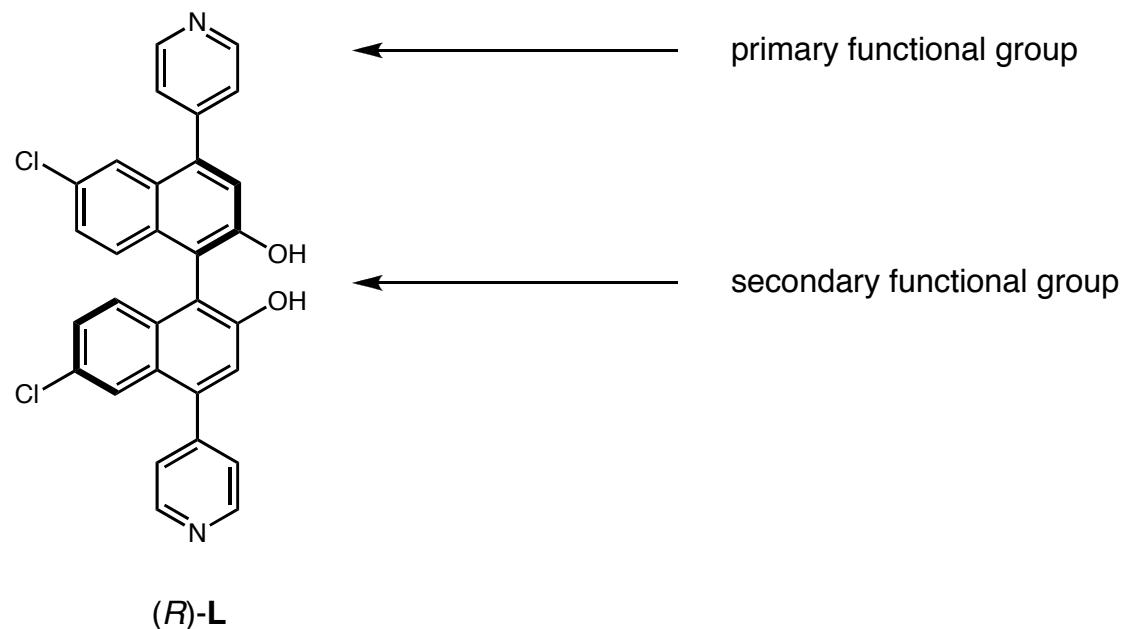

■ Multifunctional catalysis

Privileged Metal Catalysts - BINOLate

■ Lin and coworkers showed incorporation of BINOL ligand to form homochiral MOF

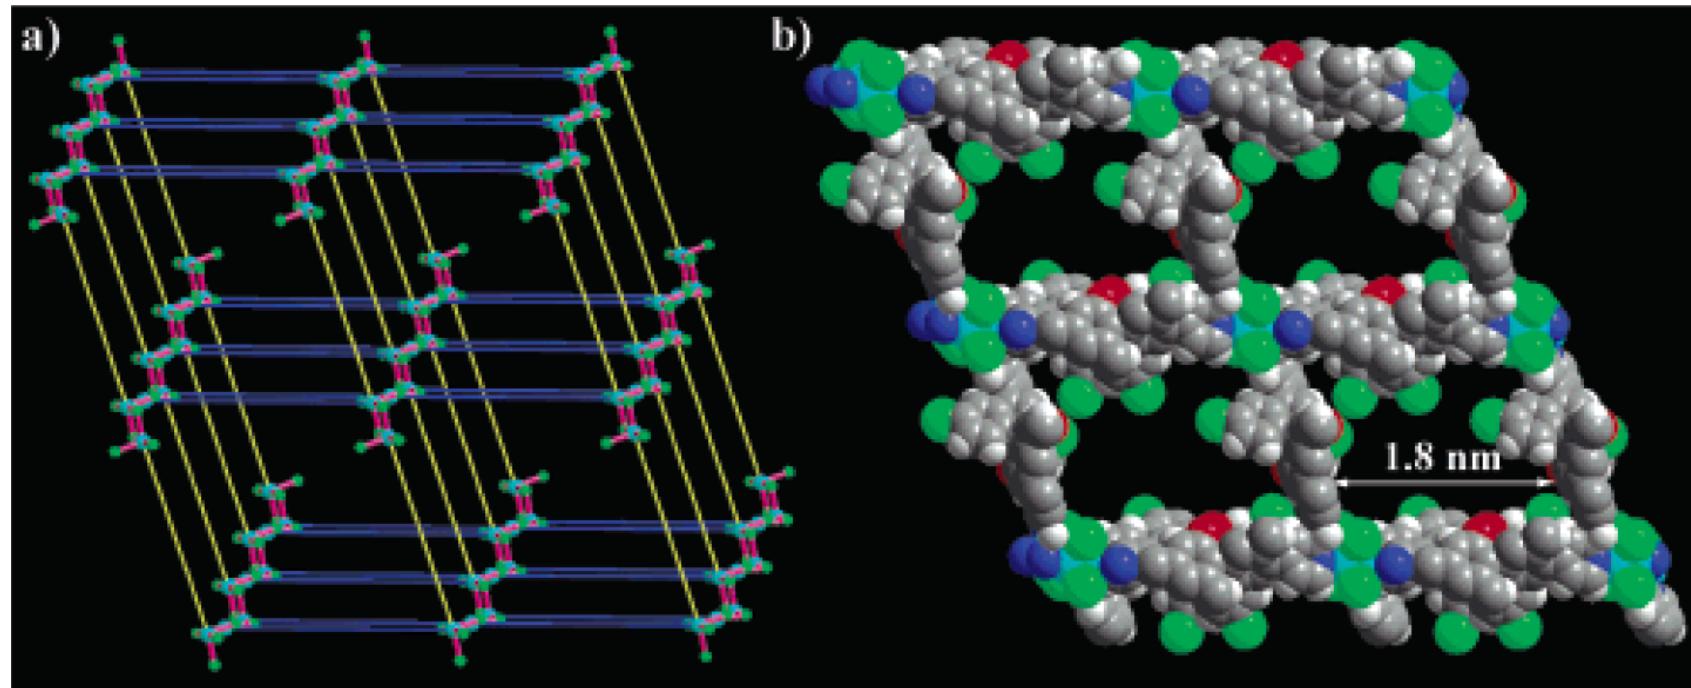

- BINOL linker contains pyridyl primary functional groups
- Chiral secondary groups can act as asymmetric catalytic sites
- In combination with CdCl_2 , (R) -L forms MOF with $[\text{Cd}(\mu\text{-Cl})_2]_n$ SBUs bridged by L

Privileged Metal Catalysts - BINOLate

■ Lin and coworkers showed incorporation of BINOL ligand to form homochiral MOF

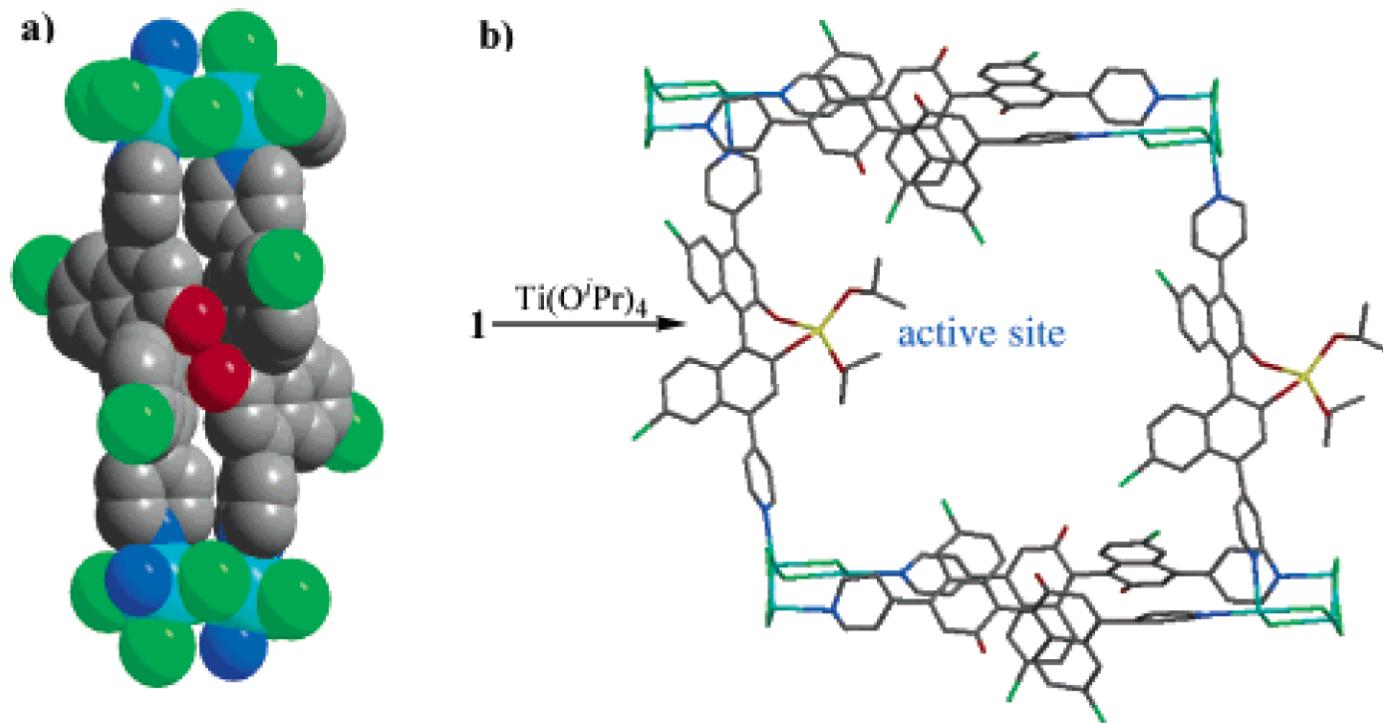

- BINOL linker contains pyridyl primary functional groups
- Chiral secondary groups can act as asymmetric catalytic sites
- In combination with CdCl_2 , (*R*)-L forms MOF with $[\text{Cd}(\mu\text{-Cl})_2]_n$ SBUs bridged by L

Privileged Metal Catalysts - BINOLate

■ BINOLate MOF **1** binds $Ti(O^iPr)_2$ to form active catalyst

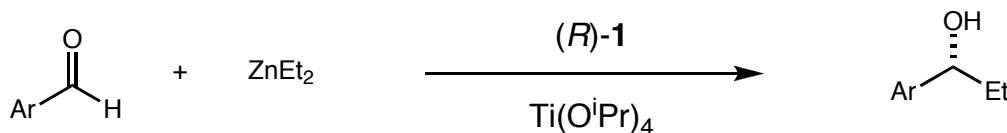

- Strong H-bonding and $\pi-\pi$ interactions hold two horizontal **L** linkers together (catalytically inactive) (**a**)
- Axial linker serves as active catalytic site with dihydroxy groups directed into the open channel (**b**)

Privileged Metal Catalysts - BINOLate

■ BINOLate MOF **1•Ti** catalyzes enantioselective $ZnEt_2$ addition to aromatic aldehydes

- Affords chiral secondary alcohols through Lewis Acidic activation
- Enantioselectivity matches homogeneous variant closely

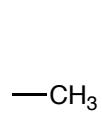

Ar	BINOL/Ti(O <i>i</i> Pr) ₄		1•Ti	
	conv %	ee %	conv %	ee %
1-Naph	>99	94	>99	93
Ph	>99	88	>99	83
4-Cl-Ph	>99	86	>99	80
3-Br-Ph	>99	84	>99	80

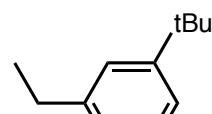

Privileged Metal Catalysts - BINOLate

■ Size selectivity experiments show catalysis is occurring exclusively within the pores

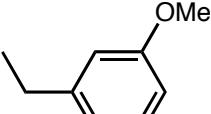

- **G1'** and **G1** show diminished efficiency while **G2'** does not react at all
- Enantioselectivity matches homogeneous variant closely

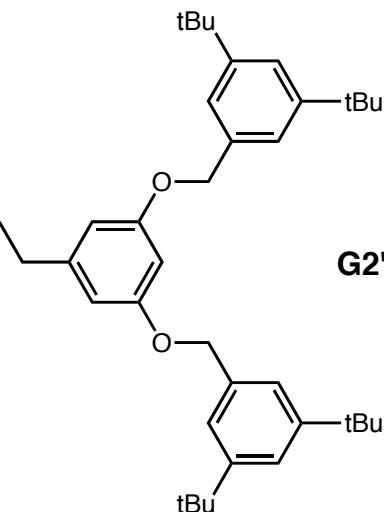

G0

G1'

G1

G2'

Ar	BINOL/Ti(O <i>i</i> Pr) ₄		1·Ti	
	conv %	ee %	conv %	ee %
4'-G ₀ OPh	>99	80	>99	88
4'-G ₁ 'OPh	>99	75	73	77
4'-G ₁ OPh	>99	78	63	81
4'-G ₂ 'OPh	95 ^b	67 ^b	0	—

Privileged Metal Catalysts - BINOLate

■ Size selectivity experiments show catalysis is occurring exclusively within the pores

- **G1'** and **G1** show diminished efficiency while **G2'** does not react at all
- Enantioselectivity matches homogeneous variant closely

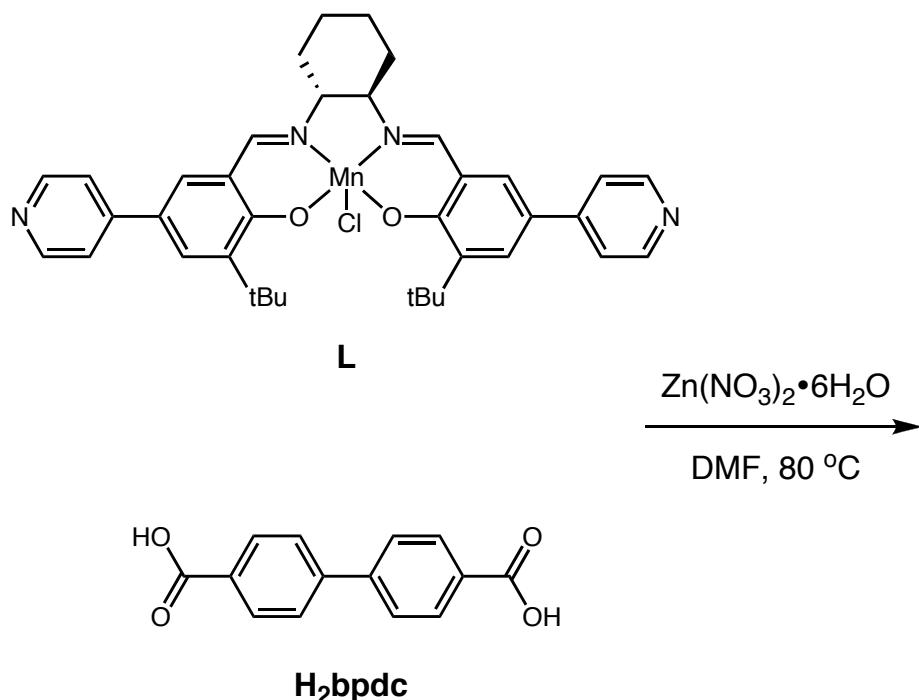

■ **1•Ti** established as a heterogeneous, more reactive BINOL catalyst

- Catalyst loading is lower for MOF than homogeneous ligand (13 mol% compared to 20 mol%)
- Only one third of **L** ligands are involved in catalysis
- Degree of asymmetric induction surpasses that of any previous homochiral MOF

Privileged Metal Catalysts - Salen

■ Hupp and Nguyen have installed Mn(salen) linkers into MOF scaffold

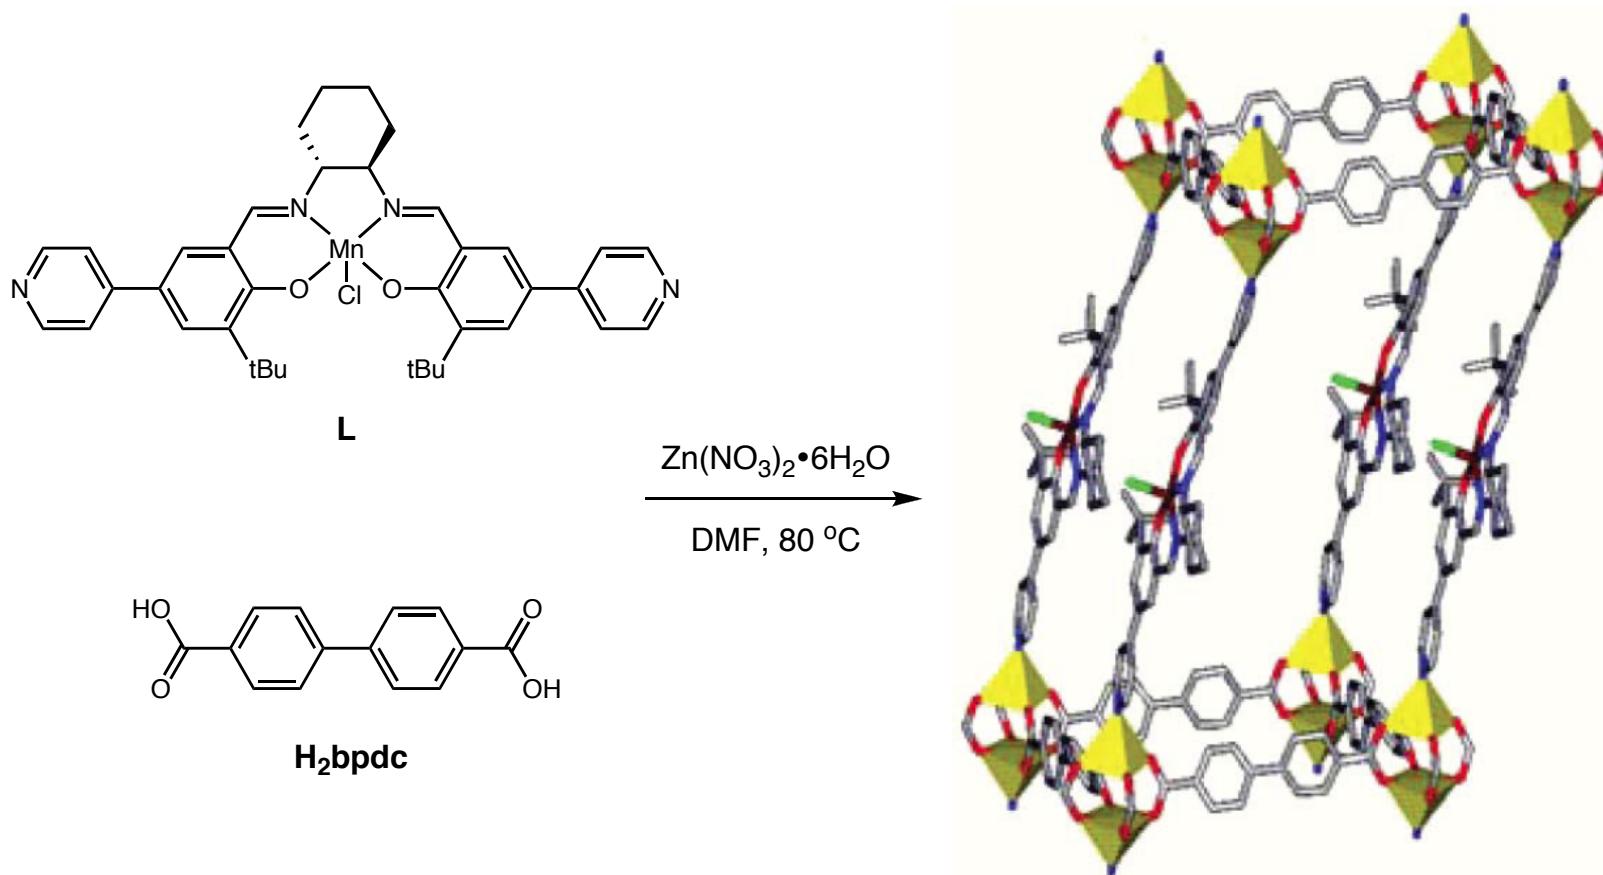

- A multi-ligand approach imparts structural stability (**L** and **H₂bpdc**)

Privileged Metal Catalysts - Salen

■ Hupp and Nguyen have installed Mn(salen) linkers into MOF scaffold

- A multi-ligand approach imparts structural stability (**L** and **H₂bpdc**)

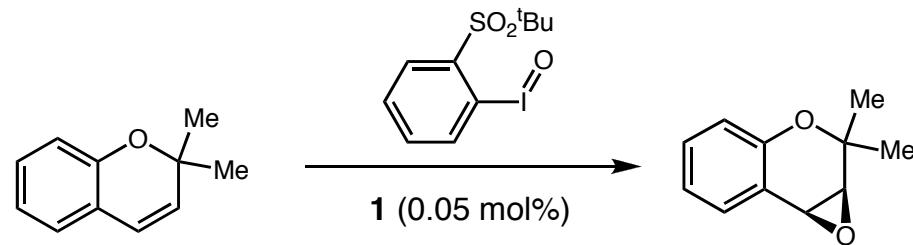

Cho, S. H.; Ma, B.; Nguyen, S. T.; Hupp, J. T.; Albrecht-Schmitt, T. E. *Chem. Commun.* **2006**, 24, 2563-2565.

Privileged Metal Catalysts - Salen

■ Mn(salen) MOF (**1**) is highly effective asymmetric catalyst for olefin epoxidation

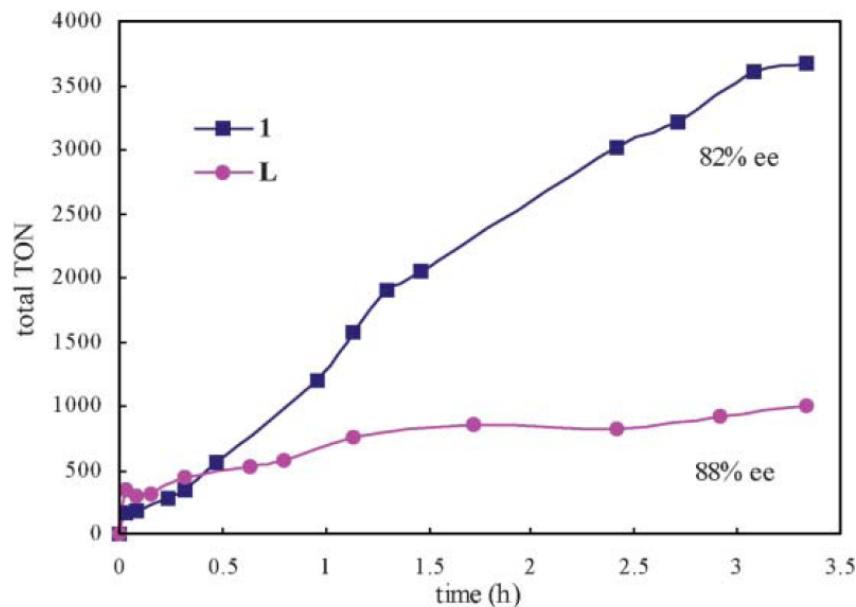

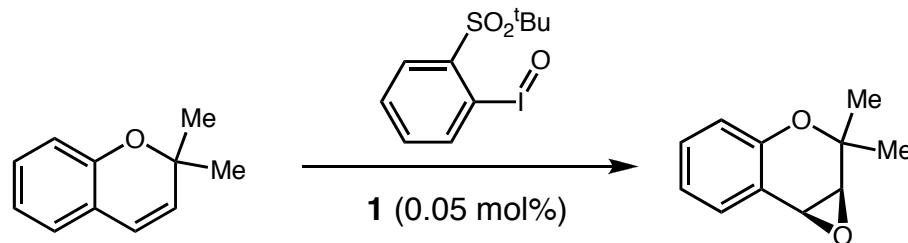

- Examined catalytic activity with 2,2-dimethyl-2H-chromene

Privileged Metal Catalysts - Salen

■ Mn(salen) MOF (**1**) is highly effective asymmetric catalyst for olefin epoxidation

- Examined catalytic activity with 2,2-dimethyl-2H-chromene

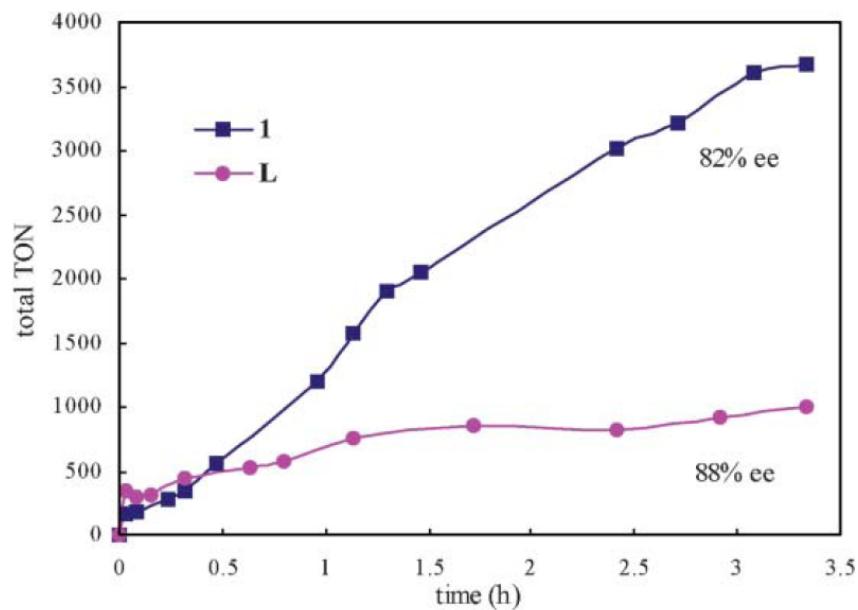

Cho, S. H.; Ma, B.; Nguyen, S. T.; Hupp, J. T.; Albrecht-Schmitt, T. E. *Chem. Commun.* **2006**, 24, 2563-2565.

Privileged Metal Catalysts - Salen

■ Mn(salen) MOF (**1**) is highly effective asymmetric catalyst for olefin epoxidation

- Immobilization of salen complexes avoids oxidative deactivation
- Minor decrease in % ee possibly due to electronic withdrawing effect of pyridyl-zinc binding

Cho, S. H.; Ma, B.; Nguyen, S. T.; Hupp, J. T.; Albrecht-Schmitt, T. E. *Chem. Commun.* **2006**, 24, 2563-2565.

Privileged Metal Catalysts - Salen

■ Mn(salen) MOF (**1**) is highly effective asymmetric catalyst for olefin epoxidation

- Immobilization of salen complexes avoids oxidative deactivation
- Minor decrease in % ee possibly due to electronic withdrawing effect of pyridyl-zinc binding
- Size selectivity experiments shows catalysis occurs predominantly within pores
- Intentional catalyst oxidation of MOF surface dramatically improves substrate size selectivity
- Recycling **1** shows similar reactivity and identical enantioselectivity

Table 1 Recyclability of **1** in the asymmetric epoxidation of 2,2-dimethyl-2H-chromene^a

Entry	Cycle ^b	Yield [%] ^c	TON	ee [%] ^d
1	1st	71	1430	82
2	2nd	71	1420	82
3	3rd	66	1320	82

Privileged Metal Catalysts - Metallocporphyrins

■ Metallocporphyrins have recently become a new class of catalytically active linkers in MOFs

- PIZA-3 showed first catalytic activity, but exclusively on exterior of framework

Suslick, K. S.; Bhyrappa, P.; Chou, J. -H.; Kosal, M. E.; Nakagaki, S.; Smithery, D. W.; Wilson, S. R. *Acc. Chem. Res.* **2005**, *38*, 263-291.

Shultz, A. M.; Farha, O. K.; Hupp, J. T.; Nguyen, S. T. *J. Am. Chem. Soc.* **2009**, *131*, 4204-4205.

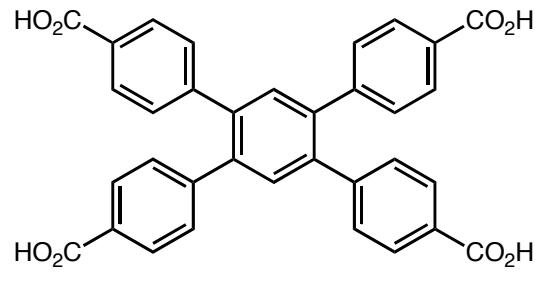

Privileged Metal Catalysts - Metallocporphyrins

■ Metallocporphyrins have recently become a new class of catalytically active linkers in MOFs

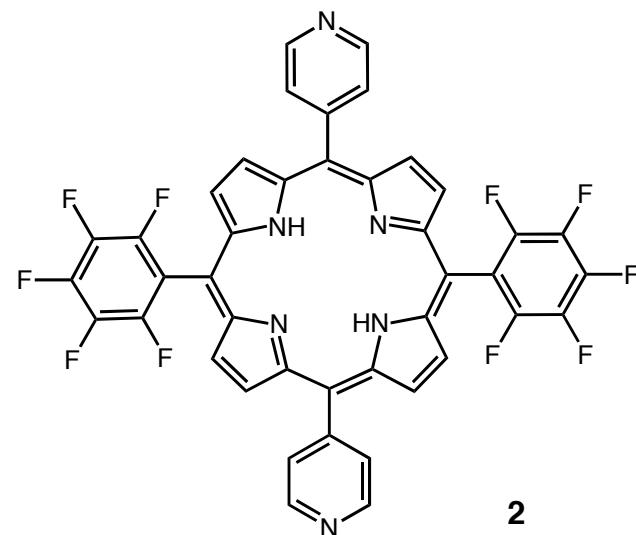

- PIZA-3 showed first catalytic activity, but exclusively on exterior of framework

■ Mixed-ligand strategy enables metallocporphyrin incorporation with large pore size

- Tetratopic linker **1** adds rigidity to MOF and results in permanent microporosity
- Free-base porphyrin **2** avoids interpenetration or catalyst deactivation
- **2** gets metallated with Zn during solvothermal synthesis

Privileged Metal Catalysts - Metallocporphyrins

■ Mixed-ligand strategy enables metallocporphyrin incorporation with large pore size

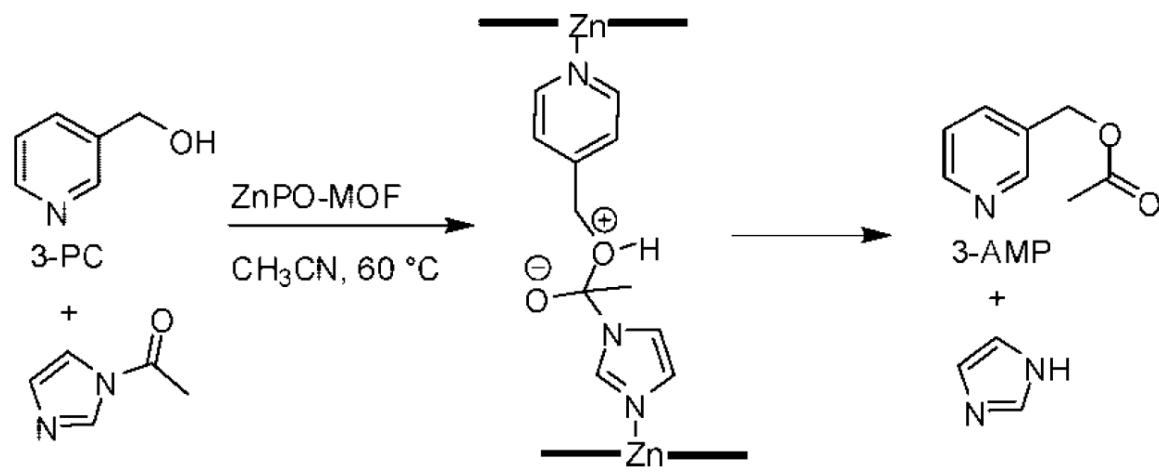

- Tetratopic linker **1** adds rigidity to MOF and results in permanent microporosity
- Free-base porphyrin **2** avoids interpenetration or catalyst deactivation
- **2** gets metallated with Zn during solvothermal synthesis

Shultz, A. M.; Farha, O. K.; Hupp, J. T.; Nguyen, S. T. *J. Am. Chem. Soc.* **2009**, *131*, 4204-4205.

Privileged Metal Catalysts - Metallocporphyrins

■ ZnPO-MOF shows catalytic activity for acyl-transfer reaction

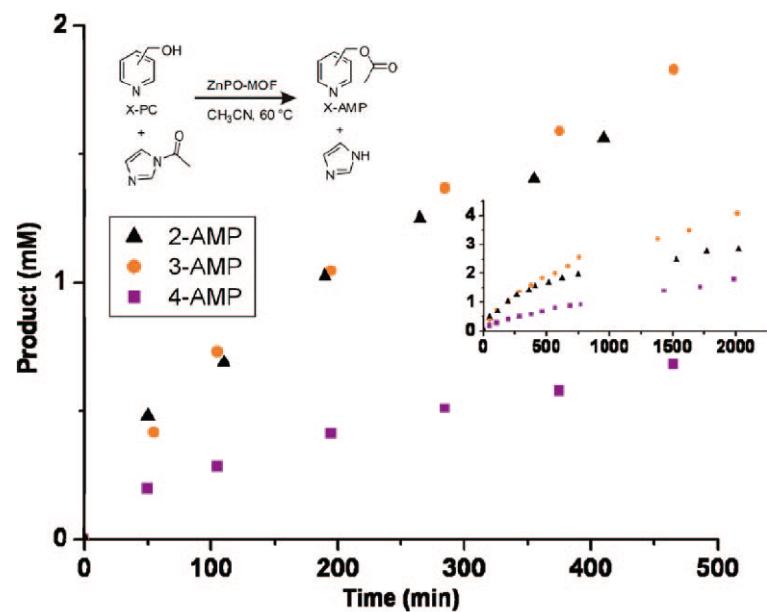

Observed 2420-fold rate enhancement compared to uncatalyzed reaction

Privileged Metal Catalysts - Metallocporphyrins

- ZnPO-MOF shows catalytic activity for acyl-transfer reaction
- Three possible mechanistic explanations for rate acceleration with ZnPO-MOF:
 - 1) Lewis Acid activation
 - 2) Coordination to Zn concentrates both reactants within pores (no effect to activation energy)
 - 3) Coordination to Zn orients and aligns reactants for favorable acyl transfer

Privileged Metal Catalysts - Metallocporphyrins

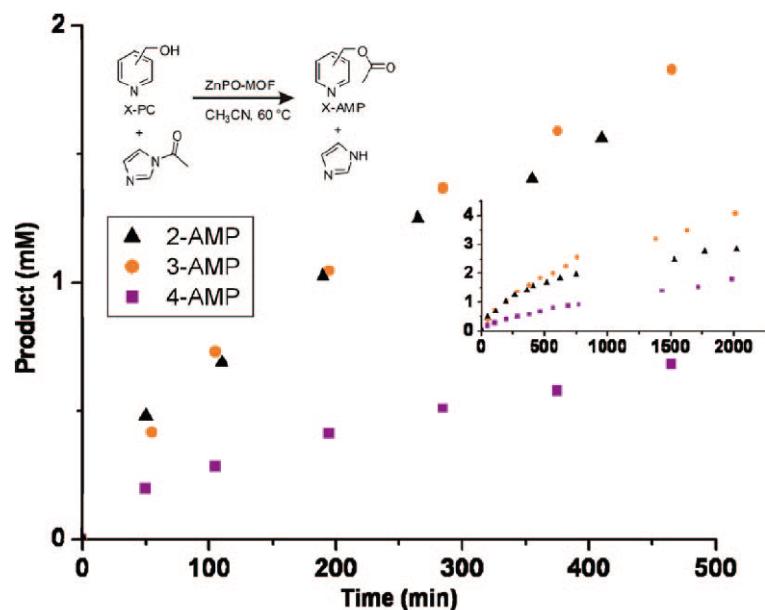

- ZnPO-MOF shows catalytic activity for acyl-transfer reaction
- Three possible mechanistic explanations for rate acceleration with ZnPO-MOF:
 - 1) Lewis Acid activation
 - 2) Coordination to Zn concentrates both reactants within pores (no effect to activation energy)
 - 3) Coordination to Zn orients and aligns reactants for favorable acyl transfer

Shultz, A. M.; Farha, O. K.; Hupp, J. T.; Nguyen, S. T. *J. Am. Chem. Soc.* **2009**, *131*, 4204-4205.

Privileged Metal Catalysts - Metallocporphyrins

- ZnPO-MOF shows catalytic activity for acyl-transfer reaction
- Three possible mechanistic explanations for rate acceleration with ZnPO-MOF:
 - 1) Lewis Acid activation
 - 2) Coordination to Zn concentrates both reactants within pores (no effect to activation energy)
 - 3) Coordination to Zn orients and aligns reactants for favorable acyl transfer

Little sensitivity to reaction rate with differing substrate isomers - 3rd mechanism is unlikely to be significant

Privileged Metal Catalysts - Metallocporphyrins

- ZnPO-MOF shows catalytic activity for acyl-transfer reaction
- Three possible mechanistic explanations for rate acceleration with ZnPO-MOF:

Reaction with homogeneous (tetraphenylporphyrin)Zn = ~22-fold rate enhancement

Both LA activation and preconcentration (more significant) are active

Privileged Metal Catalysts - Metallocporphyrins

- ZnPO-MOF shows catalytic activity for acyl-transfer reaction
- Three possible mechanistic explanations for rate acceleration with ZnPO-MOF:

Reaction with homogeneous (tetraphenylporphyrin)Zn = ~22-fold rate enhancement

Both LA activation and preconcentration (more significant) are active

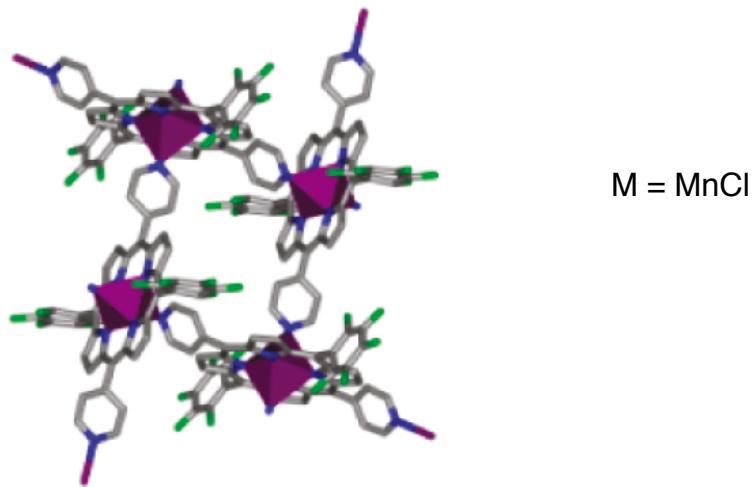

- Inhibitory effect:

- Imidazole product acts as modest inhibitor of catalytic Zn sites (stronger Lewis base than NAI)

Privileged Metal Catalysts - Metalloporphyrins

■ Expanding metalloporphyrin-containing MOFs to different metals has proved challenging

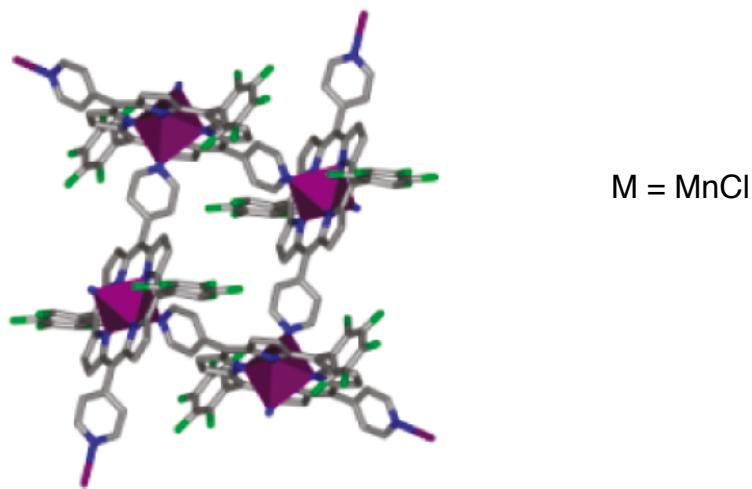

- Pre-installing metal resulted in it acting as an auxilliary node
- The free base would sequester zinc ions during MOF synthesis

Privileged Metal Catalysts - Metalloporphyrins

■ Expanding metalloporphyrin-containing MOFs to different metals has proved challenging

- Pre-installing metal resulted in it acting as an auxilliary node
- The free base would sequester zinc ions during MOF synthesis

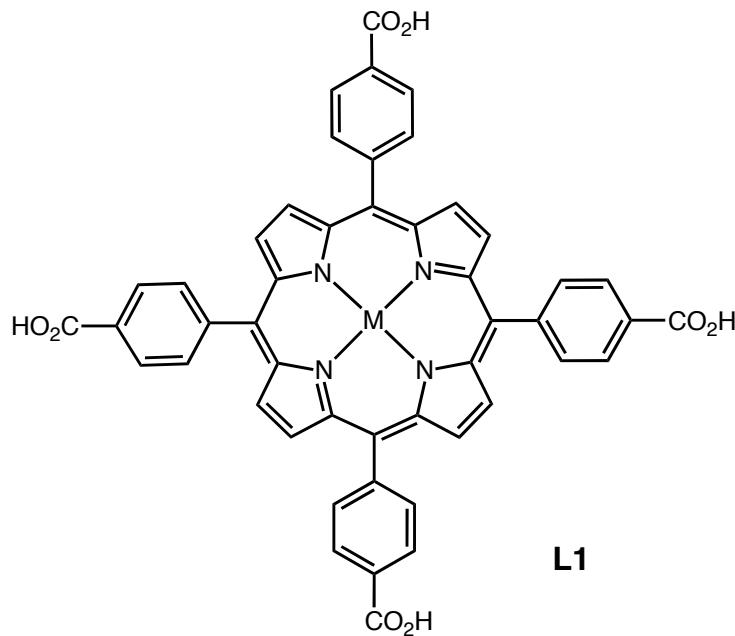

■ New synthetic approach enables incorporation of a variety of metalloporphyrins

- **RPMs** - Robust Porphyrinic Materials posess two unique metal-containing linkers

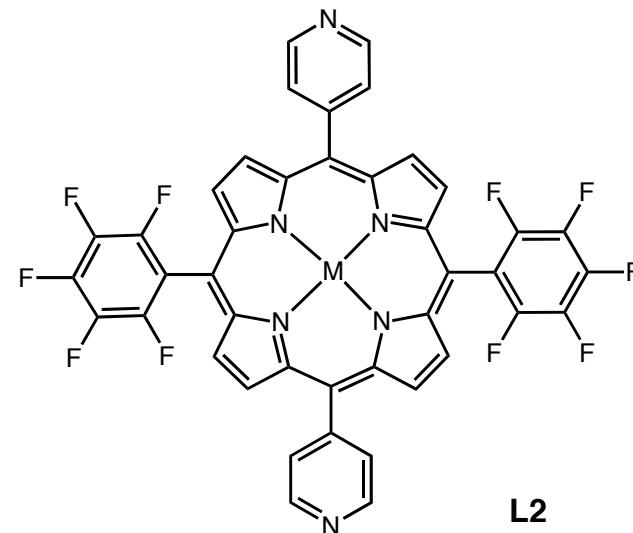

Privileged Metal Catalysts - Metallocporphyrins

■ RPMs employ two metallocporphyrin linkers **L1** and **L2**

- Steric bulk on **L1** prevents coordination to metallocporphyrin site
- Solubility effects: low concentration of dipyridyl subunit **L2** favors coordination at paddlewheel nodes
- Order of ligand addition is essential: **L2** added after **L1** and $\text{Zn}(\text{NO}_3)_2$ have begun to assemble

L1

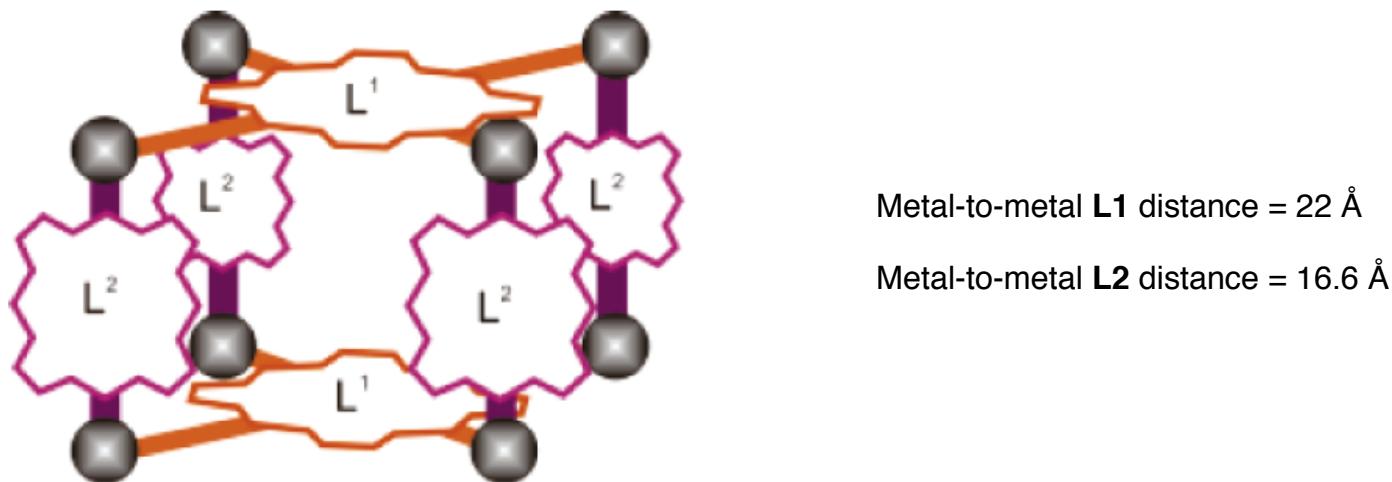

L2

Privileged Metal Catalysts - Metallocoporphyrins

■ RPMs can contain numerous metal catalytic sites

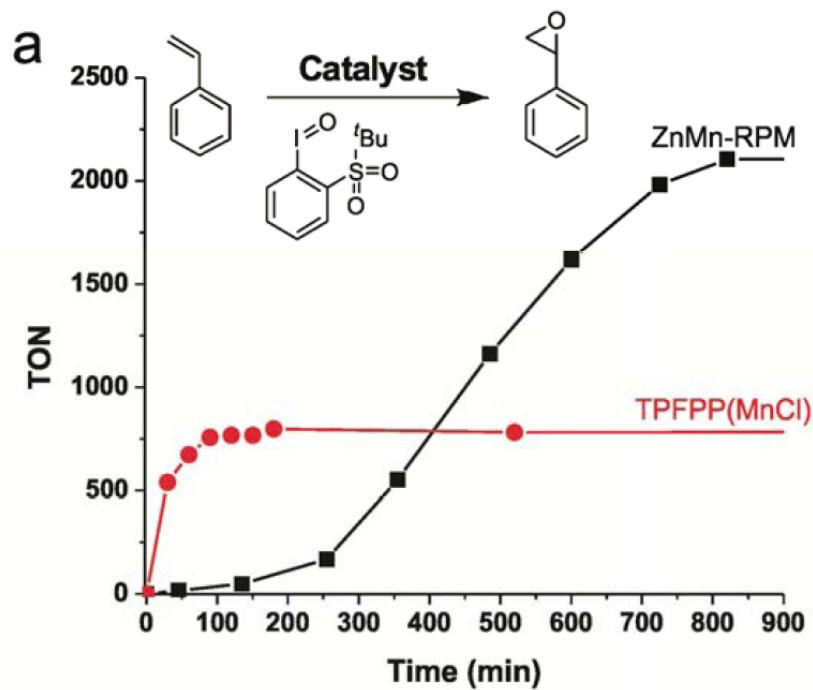

- **L1** = Al³⁺, Pd²⁺, Fe³⁺, or free base (Zn²⁺)
- **L2** = Mn³⁺ or free base (Zn²⁺)
- Fe- and Mn-porphyrins axially ligate Cl⁻, Al-porphyrin axially ligates HO⁻
- MOF structures are identical: **L1** forms 2D sheets with dimeric Zn nodes, pillared by **L2**

Privileged Metal Catalysts - Metallocporphyrins

■ ZnMn-RPM (M1M2-RPM) functions as effective heterogeneous oxidation catalyst

- Epoxidation of styrene and hydroxylation of cyclohexane
- Deactivation of MOF catalytic sites avoided due to difficulty in forming μ -oxo dimer complexes

- Homogeneous Mn(porphyrin) showed 780 turnovers, before catalyst deactivation
- ZnMn-RPM showed 2150 turnovers before depletion of oxidant
- Induction period due to slow diffusion in and out of MOF pores

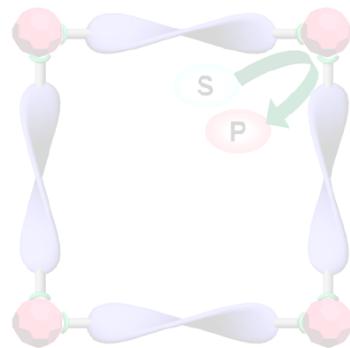

Privileged Metal Catalysts - Metallocporphyrins

■ RPMs = first class of dual metallocporphyrin incorporation into MOF scaffold

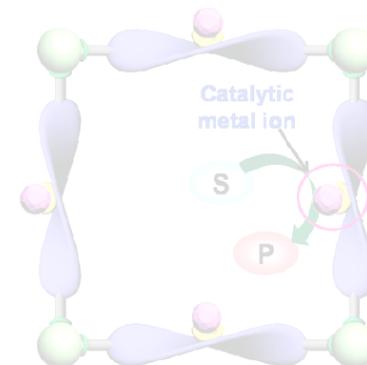

- Versatile and modular method for diverse metallocporphyrin MOF synthesis
- Potential for multiple catalytic sites and therefore cooperative/synergistic catalysis

Diverse Strategies for Metal-Organic Framework Catalysis

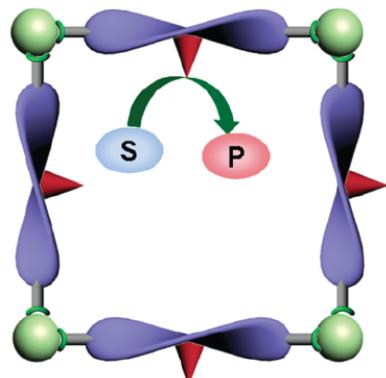

■ Metal node catalysis

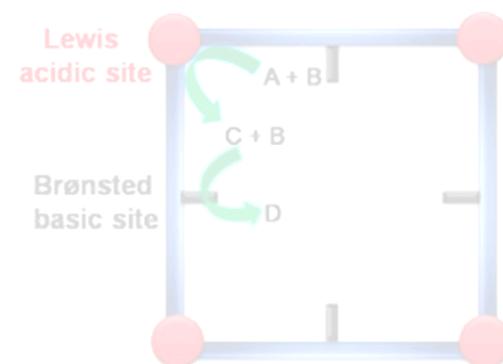

■ Privileged metal catalyst

■ Organocatalytic linkers

■ Multifunctional catalysis

Organocatalytic Linkers

■ Inherent difficulties with installing organocatalytic units in MOFs

- Interfere with synthesis - coordination to metal ions possible
- Catenation/interpenetration may prevent porous structure formation

Organocatalytic Linkers

■ Inherent difficulties with installing organocatalytic units in MOFs

- Interfere with synthesis - coordination to metal ions possible
- Catenation/interpenetration may prevent porous structure formation

■ Protected organocatalytic linkers can avoid these pitfalls (post-synthetic modification)

- Thermolabile Boc protecting group removed upon heating
- Prevents interpenetration and allows facile access to pores
- Reveals active amino functional group

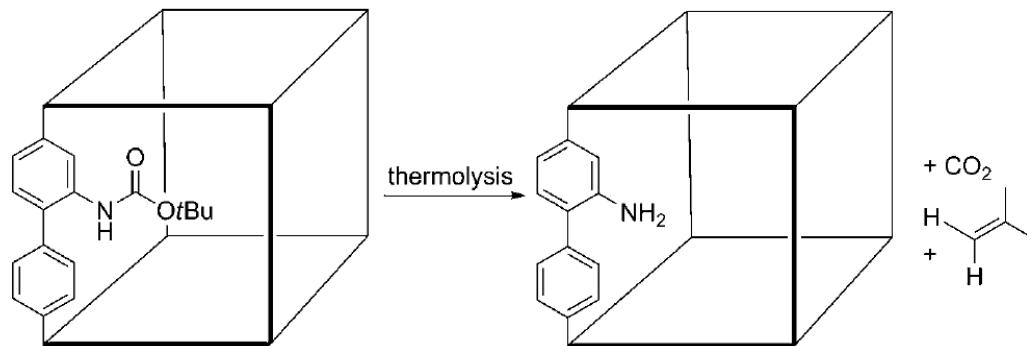

Organocatalytic Linkers

■ Inherent difficulties with installing organocatalytic units in MOFs

- Interfere with synthesis - coordination to metal ions possible
- Catenation/interpenetration may prevent porous structure formation

■ Protected organocatalytic linkers can avoid these pitfalls (post-synthetic modification)

- Thermolabile Boc protecting group removed upon heating
- Prevents interpenetration and allows facile access to pores
- Reveals active amino functional group

Deshpande, R. K.; Minnaar, J. L.; Telfer, S. G. *Angew. Chem. Int. Ed.* **2010**, *49*, 4598-4602.

Organocatalytic Linkers

■ Protected organocatalytic linkers can avoid these pitfalls (post-synthetic modification)

- Thermolabile Boc protecting group removed upon heating
- Prevents interpenetration and allows facile access to pores
- Reveals active amino functional group

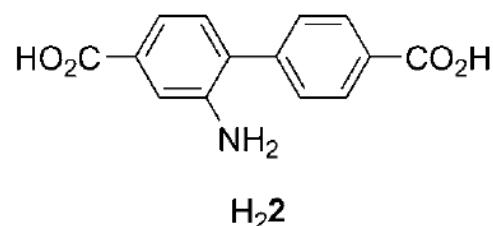

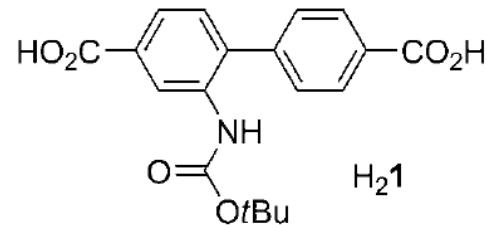

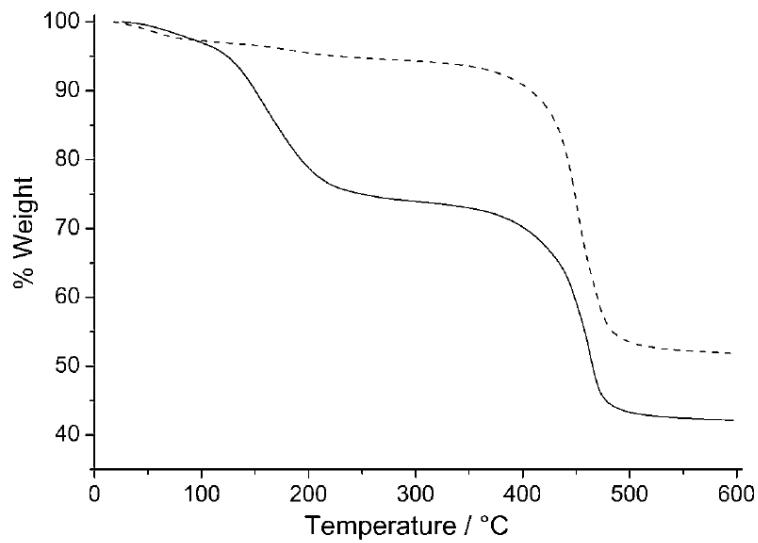

Figure 2. Thermogravimetrograms of $[Zn_4O(\mathbf{1})_3]$ (solid line) and $[Zn_4O(\mathbf{2})_3]$ (dashed line) recorded under a N_2 atmosphere with a heating rate of $5\text{ }^\circ\text{C min}^{-1}$.

Organocatalytic Linkers - Proline

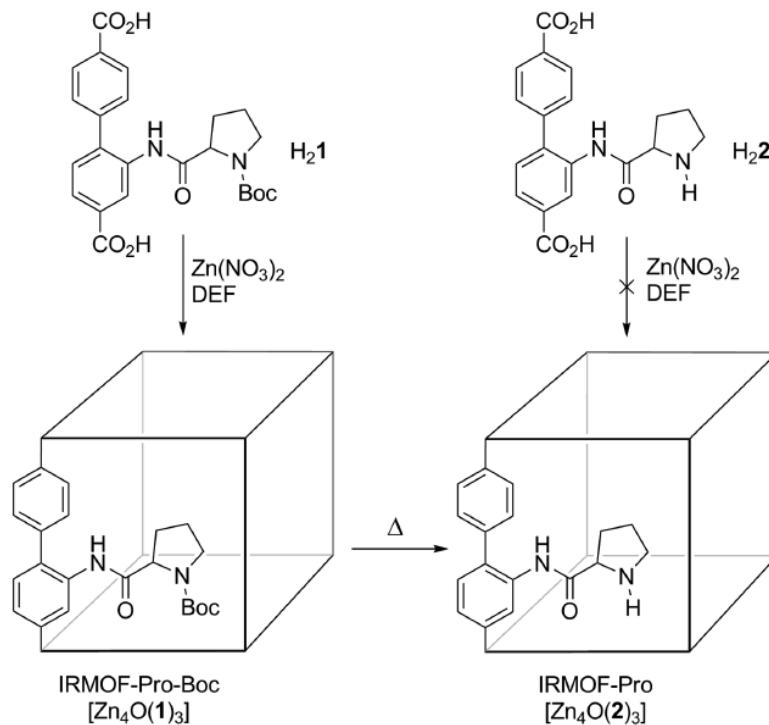

■ Shane Telfer - cubic Zn(II) IRMOF-Pro contains organocatalytic proline motif

- "Isoreticular" cubic framework (IRMOF)
- Unprotected organic linker ineffective in MOF synthesis
- Post-synthetic thermal Boc-deprotection necessary

Organocatalytic Linkers - Proline

■ Shane Telfer - cubic Zn(II) IRMOF-Pro contains organocatalytic proline motif

- "Isoreticular" cubic framework (IRMOF)
- Unprotected organic linker ineffective in MOF synthesis
- Post-synthetic thermal Boc-deprotection necessary

Lun, D. J.; Waterhouse, G. I. N.; Telfer, S. G. *J. Am. Chem. Soc.* **2011**, *133*, 5806-5809.

Organocatalytic Linkers - Proline

■ Shane Telfer - cubic Zn(II) IRMOF-Pro contains organocatalytic proline motif

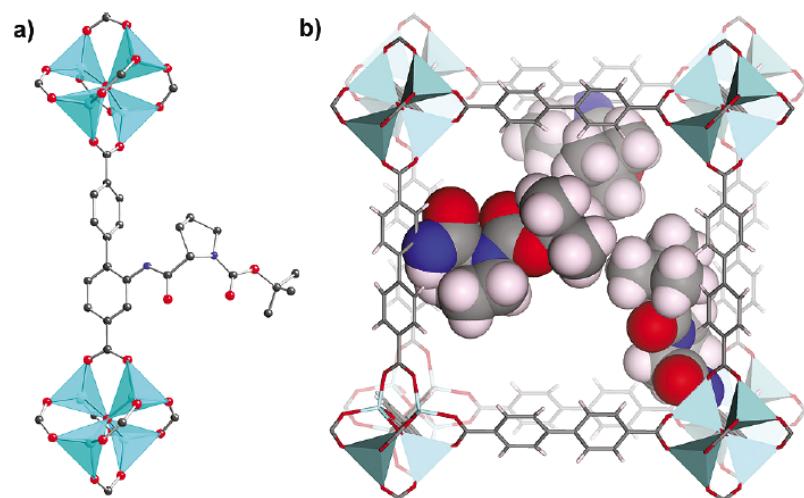

Figure 1. Structure of IRMOF-Pro-Boc as determined by X-ray crystallography. (a) Ligand strut and Zn₄O nodes. Gray = C; red = O; blue = N; turquoise = Zn. Hydrogen atoms have been omitted for clarity. (b) Typical cubic repeating unit. One set of the statistically disordered N-Boc-proline side chains is shown.

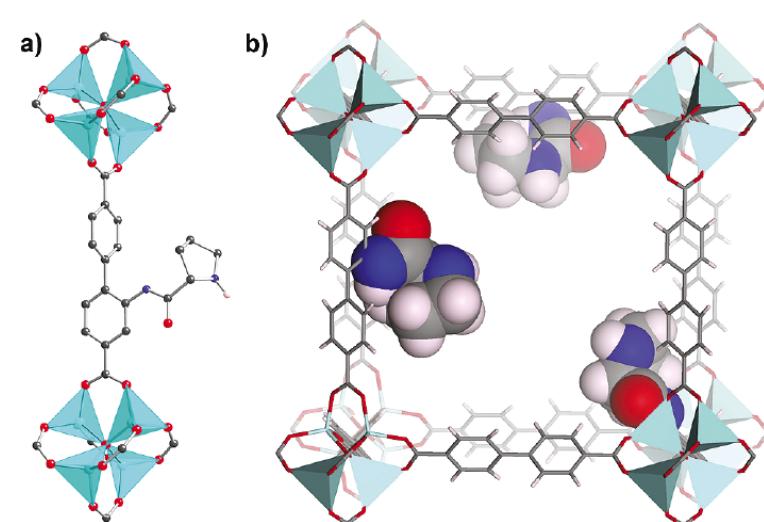

Figure 3. Structure of IRMOF-Pro as determined by X-ray crystallography. (a) Ligand strut and Zn₄O nodes. Gray = C; red = O; blue = N; turquoise = Zn. Most of the hydrogen atoms have been omitted for clarity. (b) Typical cubic repeating unit. One set of the statistically disordered proline side chains is shown.

Organocatalytic Linkers - Proline

■ IRMOF-Pro demonstrates catalytic activity for asymmetric aldol reaction

Scheme 2. Aldol Reactions of Acetone and Cyclopentanone with 4-Nitrobenzaldehyde Catalyzed by IRMOF-Pro

Ketone/catalyst	Time (h)	Cat. mol % ^a	dr (syn : anti) ^b	ee ^b
acetone				
IRMOF-Pro	40	100	-	29% ^c
IRMOF-Pro-Boc	60	≥ 50	-	No reaction
H ₂ 2	96	20	-	52%
cyclopentanone				
IRMOF-Pro	30	100	1 : 3	3% (<i>syn</i>), 14% (<i>anti</i>)
IRMOF-Pro-Boc	30	≥ 50	No reaction	-
H ₂ 2	96	20	2 : 3	86% (<i>syn</i>), 78% (<i>anti</i>)

Organocatalytic Linkers - Proline

- IRMOF-Pro demonstrates catalytic activity for asymmetric aldol reaction

Scheme 2. Aldol Reactions of Acetone and Cyclopentanone with 4-Nitrobenzaldehyde Catalyzed by IRMOF-Pro

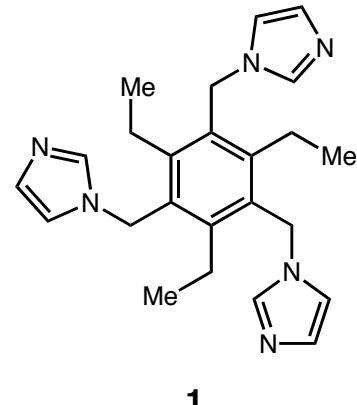

- Poor enantioselectivity attributed to:

- Minor degree of organic linker racemization in post-synthetic deprotection step
- Low facial selectivity towards enamine intermediate in large framework pore
- Absence of H-bond donors on organocatalytic unit

Organocatalytic Linkers - N-Heterocyclic Carbenes

■ TIF-1 demonstrates first example of NHC sites installed in MOF

- Tripodal imidazolate framework-1 comprised of Co(II) nodes with linker 1
- Utilizes metal imidazolates as carbene precursors
- Post-synthetic deprotonation should reveal catalytic site

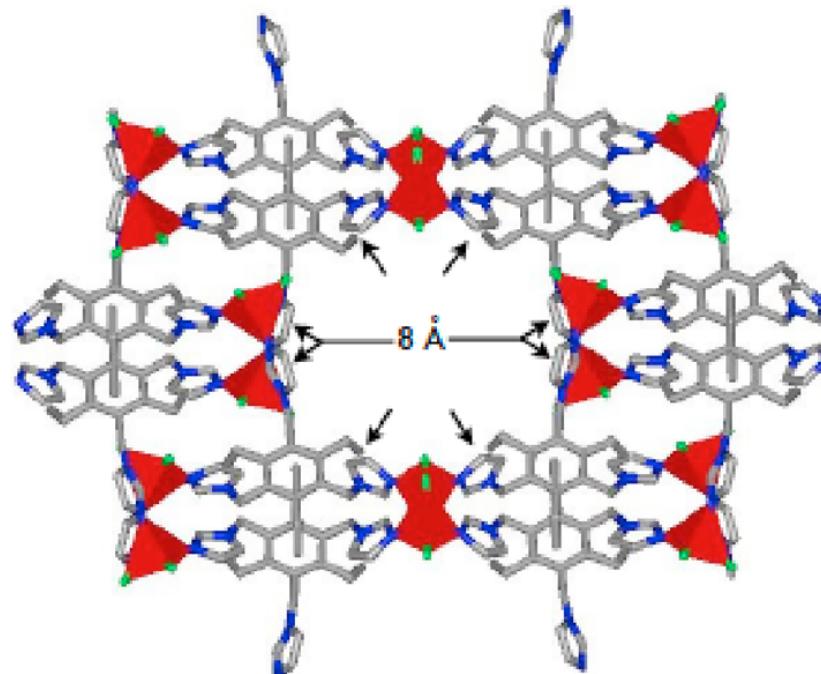

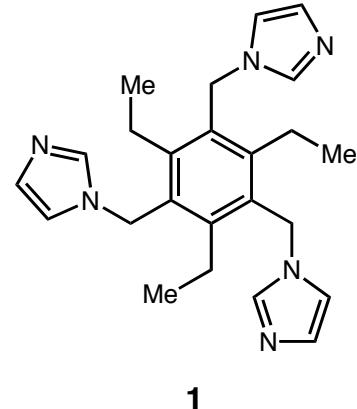

Willans et al. *Dalton Trans.* **2009**, 6480-6482.

Lalonde, M. B.; Farha, O. K.; Scheidt, K. A.; Hupp, J. T. *ACS Catal.* **2012**, 2, 1550-1554.

Organocatalytic Linkers - N-Heterocyclic Carbenes

■ TIF-1 demonstrates first example of NHC sites installed in MOF

- Tripodal imidazolate framework-1 comprised of Co(II) nodes with linker 1
- Utilizes metal imidazolates as carbene precursors
- Post-synthetic deprotonation should reveal catalytic site

Willans et al. *Dalton Trans.* **2009**, 6480-6482.

Lalonde, M. B.; Farha, O. K.; Scheidt, K. A.; Hupp, J. T. *ACS Catal.* **2012**, 2, 1550-1554.

Organocatalytic Linkers - N-Heterocyclic Carbenes

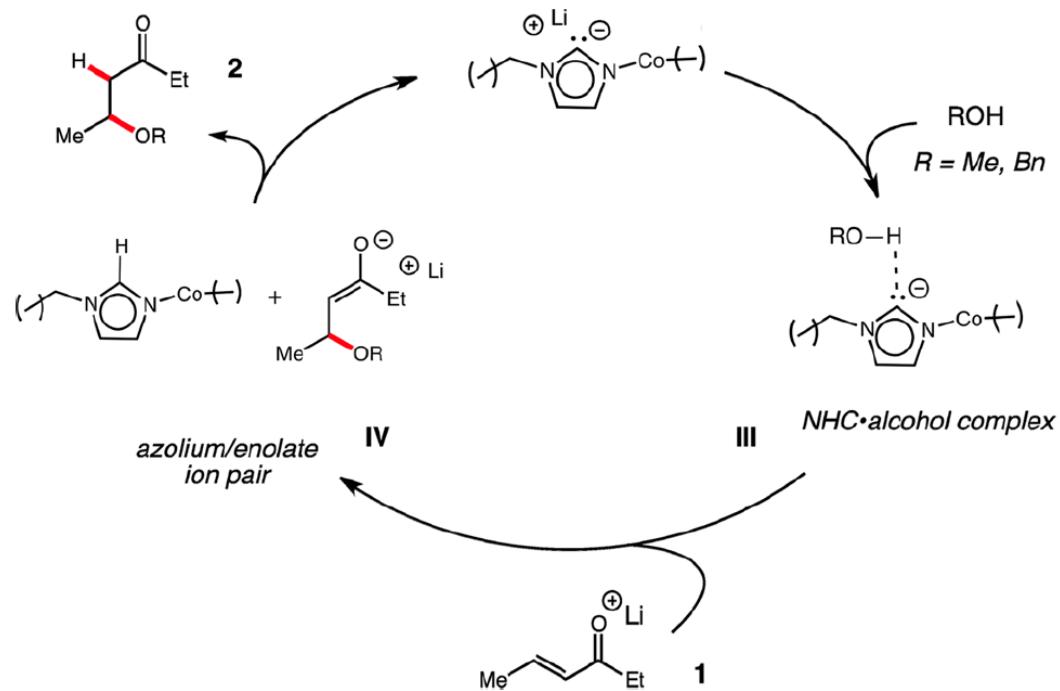

■ TIF-1 catalyzes the conjugate addition of alcohols to α,β -unsaturated ketones

- NHC sites function as Brønsted bases following n-BuLi deprotonation
- Initially believed to be C4 or C5 deprotonation (*a*NHCs) due to inaccessible C2 position in pore
- Size selective experiments suggest catalysis occurs on exterior of MOF (not within pores)

Organocatalytic Linkers - N-Heterocyclic Carbenes

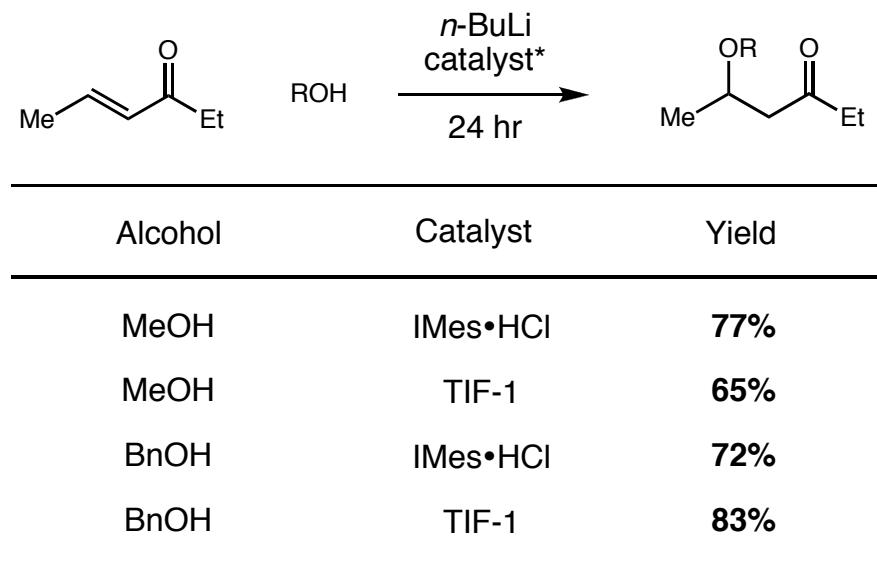

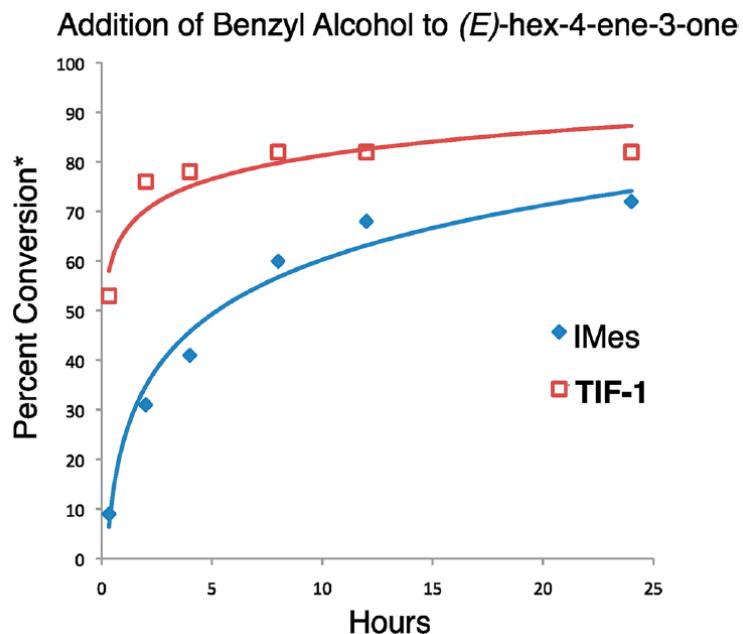

■ TIF-1 catalyzes the conjugate addition of alcohols to α,β -unsaturated ketones

- NHC sites function as Brønsted bases following n-BuLi deprotonation
- Initially believed to be C4 or C5 deprotonation (*a*NHCs) due to inaccessible C2 position in pore
- Size selective experiments suggest catalysis occurs on exterior of MOF (not within pores)

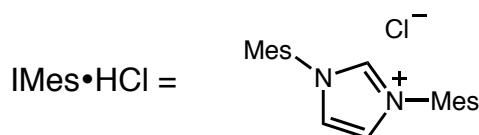

Organocatalytic Linkers - N-Heterocyclic Carbenes

- TIF-1 catalyzes the conjugate addition of alcohols to α,β -unsaturated ketones

*0.8 mol% for TIF-1, 5 mol% for IMes•HCl

Organocatalytic Linkers - N-Heterocyclic Carbenes

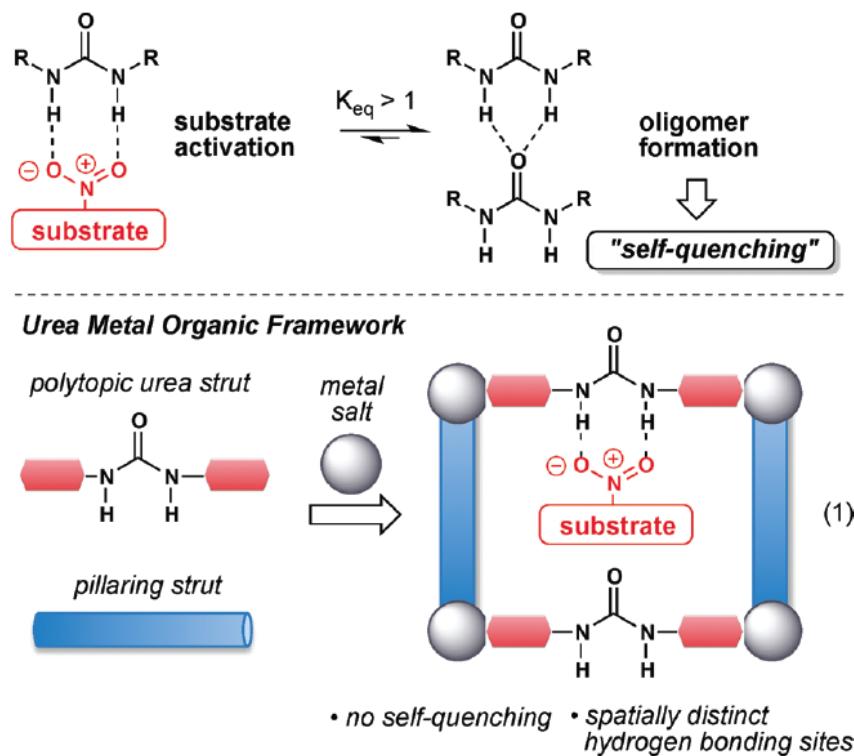

■ TIF-1 - first example of MOF-based NHC catalysis

- Only 1 in 20,000 imidazole groups are involved in catalysis (on surface)
- Several orders of magnitude more reactive than homogeneous analog
- Presence of tightly coordinated Li^+ to carbene may explain heightened reactivity
- Enlarging channels may greatly improve TIF-1 reactivity

Organocatalytic Linkers - Hydrogen-bonding Ureas

■ NU-601 contains hydrogen-bonding urea strut

- Example of installing homogeneous catalyst in heterogeneous structure
- Urea MOF would avoid oligomerization of homogeneous H-bonding catalyst (self-quenching)
- Structurally rigid linker could separate catalytic functionalities in MOF

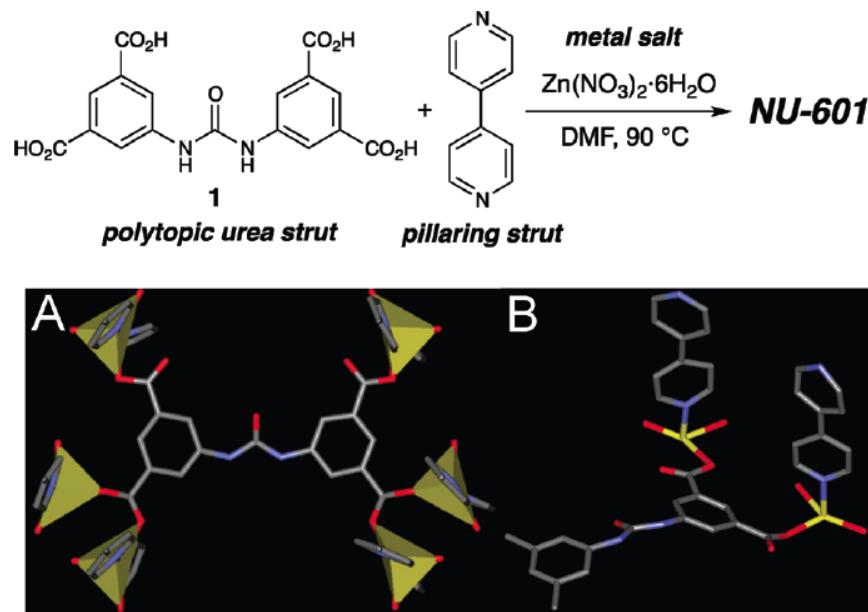

Roberts, J. M.; Fini, B. M.; Sarjeant, A. A.; Farha, O. K.; Hupp, J. T.; Scheidt, K. A. *J. Am. Chem. Soc.* **2012**, *134*, 3334-3337.

Organocatalytic Linkers - Hydrogen-bonding Ureas

■ NU-601 - Zn(4,4'-bpy)₂(1-4H)

- Carboxylic acid groups on urea linker: metal-binding sites and increases N-H acidity
- Urea group more thermally stable than thiourea in MOF synthesis

Scheme 1. (top) Synthesis of NU-601; (bottom) Views of (A) 1 and the Zn₂ Nodes and (B) the Repeating Unit of NU-601^a

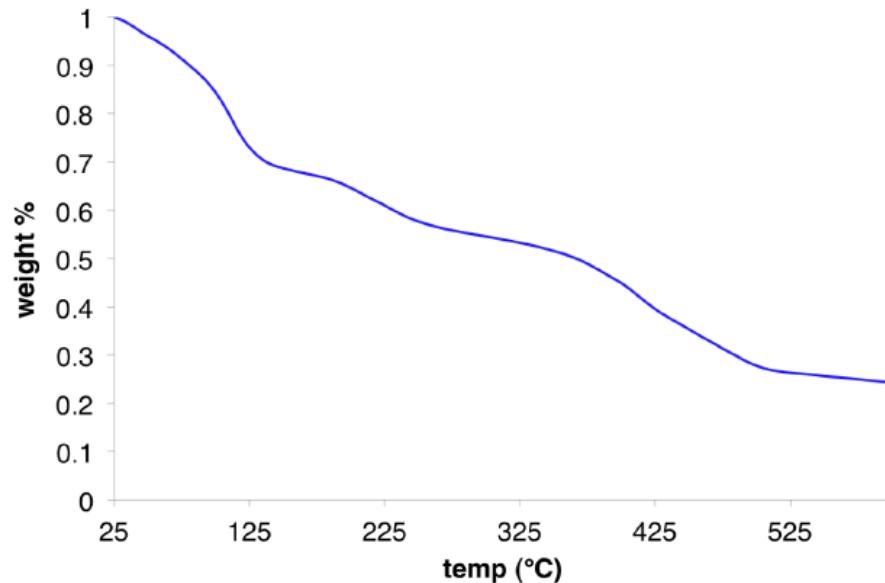

Roberts, J. M.; Fini, B. M.; Sarjeant, A. A.; Farha, O. K.; Hupp, J. T.; Scheidt, K. A. *J. Am. Chem. Soc.* **2012**, *134*, 3334-3337.

Organocatalytic Linkers - Hydrogen-bonding Ureas

■ NU-601 - catalytic activity requires accessible pores

- Residual DMF remains in pores through H-bonding to urea N-H bonds
- Thermal activation proved problematic (as demonstrated by TGA and PXRD)

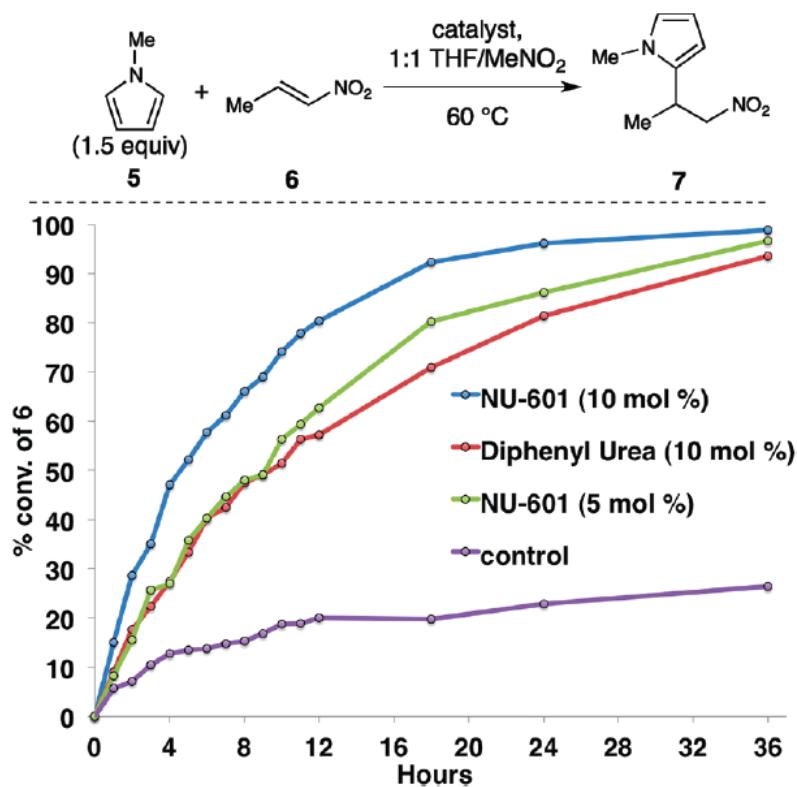

- ~30% weight loss at 125 °C
- At 200 °C, second weight loss occurs
- PXRD revealed loss of crystallinity after heating and DMF still present
- Solvent exchange with MeNO₂ over 4 days successfully removed DMF

Organocatalytic Linkers - Hydrogen-bonding Ureas

■ NU-601 catalyzes Friedel-Crafts reaction between *N*-methylpyrrole and (*E*)-1-nitroprop-1-ene

- Polar solvent combination promotes more H-bonding exchange/catalyst turnover (toluene was ineffective)
- After 36 hours, 98% of **6** was consumed

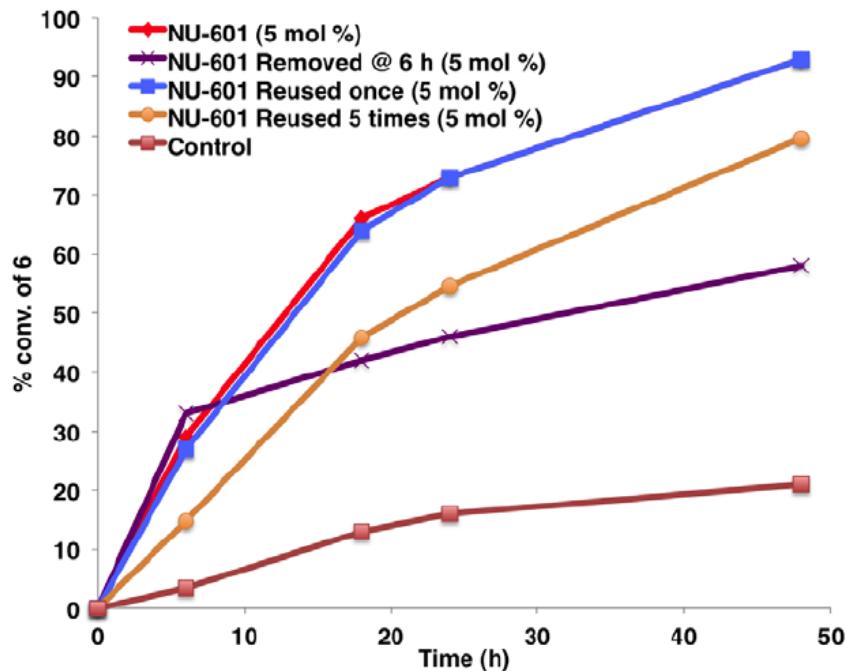

Roberts, J. M.; Fini, B. M.; Sarjeant, A. A.; Farha, O. K.; Hupp, J. T.; Scheidt, K. A. *J. Am. Chem. Soc.* **2012**, *134*, 3334-3337.

Organocatalytic Linkers - Hydrogen-bonding Ureas

■ NU-601 catalyzes Friedel-Crafts reaction between *N*-methylpyrrole and (*E*)-1-nitroprop-1-ene

- Control experiments show catalyst is heterogeneous in nature
- Only slight degradation in reactivity after multiple cycles

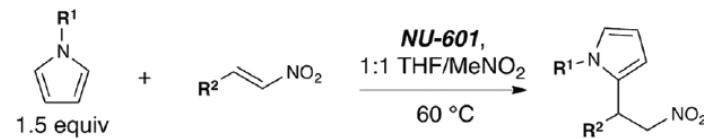

Roberts, J. M.; Fini, B. M.; Sarjeant, A. A.; Farha, O. K.; Hupp, J. T.; Scheidt, K. A. *J. Am. Chem. Soc.* **2012**, *134*, 3334-3337.

Organocatalytic Linkers - Hydrogen-bonding Ureas

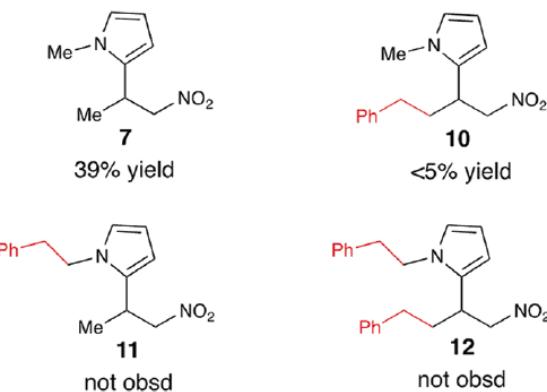

■ NU-601 catalysis is size selective

- Size selectivity experiments demonstrate that *catalysis occurs predominantly within pores of framework*
- Sterically encumbered pyrroles cannot enter the porous network
- In equimolar amounts of **6** and **9**, **5** forms product **7** exclusively (13% yield)

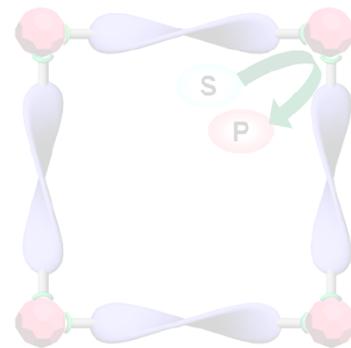

$\text{R}^1 = \text{Me, 5}$ $\text{R}^2 = \text{Me, 6}$
 $= (\text{CH}_2)_2\text{Ph, 8}$ $= (\text{CH}_2)_2\text{Ph, 9}$

observed @ 48 h (^1H NMR or GC)

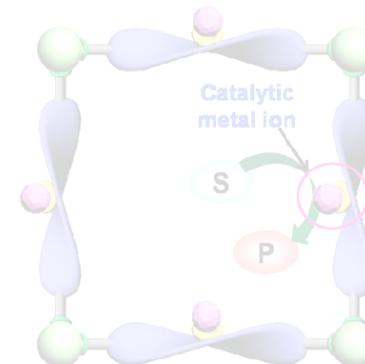

Diverse Strategies for Metal-Organic Framework Catalysis

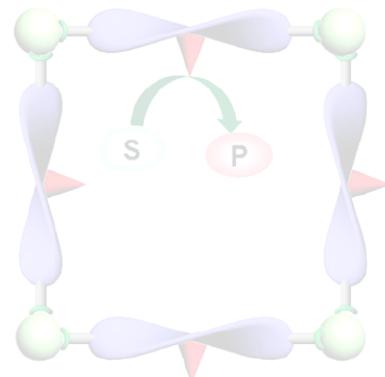

■ Metal node catalysis

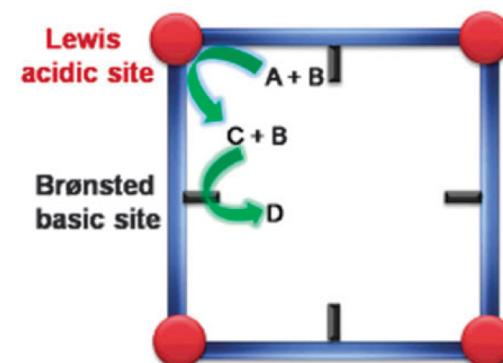

■ Privileged metal catalyst

■ Organocatalytic linkers

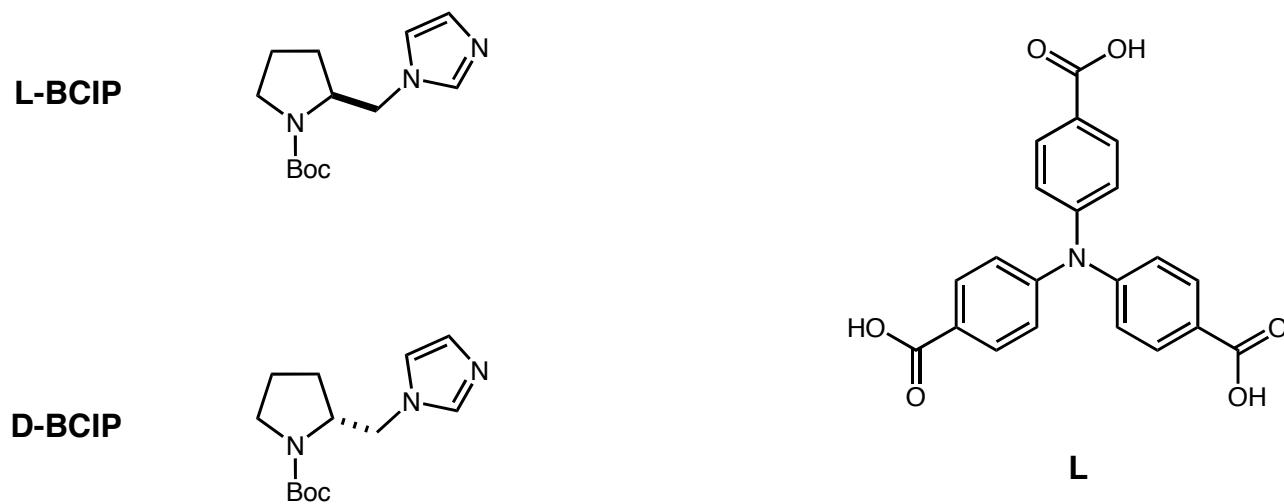

■ Multifunctional catalysis

Cooperative Catalysis - Photoredox Organocatalysis

■ Duan and coworkers combined organocatalytic and photoactive units into single MOF scaffold

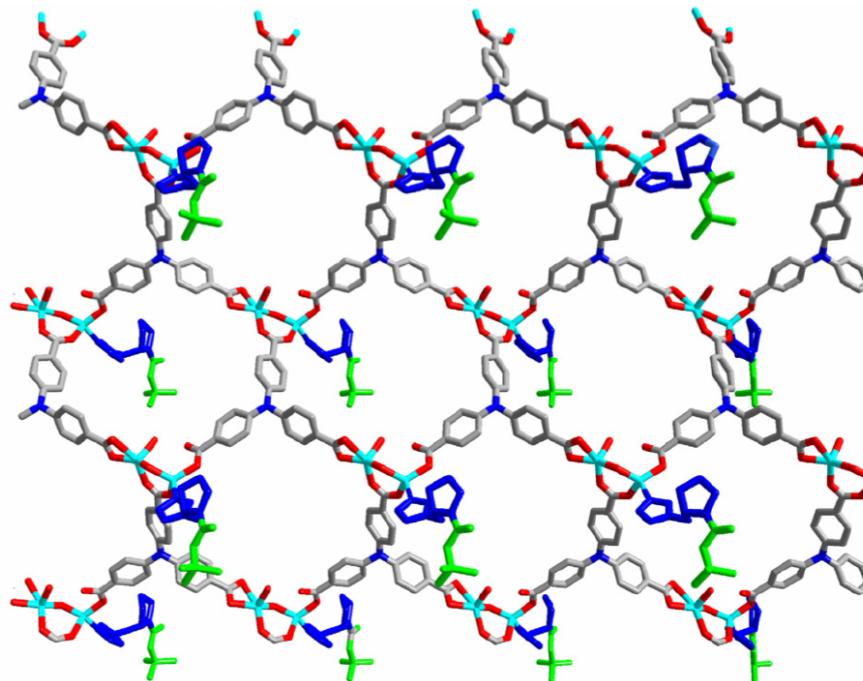

- Organocatalytic group = *L* or *D*-Boc-2-(imidazole)-1-pyrrolidine (**BCIP**)
- Photoredox catalyst = 4,4',4''-nitrilotribenzoic acid (**L**)

Cooperative Catalysis - Photoredox Organocatalysis

■ Duan and coworkers combined organocatalytic and photoactive units into single MOF scaffold

- Heating **L-BCIP** and **L** with $\text{Zn}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ yielded **Zn-BCIP1**
- Post-synthetic deprotection gave catalytically active **Zn-PYI1**
- **Zn-PYI1** is 2D sheet of **L** struts and binuclear Zn nodes.
- Imidazole coordinates to Zn nodes and points proline functionality into open cavities

Wu, P.; He, C.; Wang, J.; Peng, X.; Li, X.; An, Y.; Duan, C. *J. Am. Chem. Soc.* **2012**, *134*, 14991-14999.

Cooperative Catalysis - Photoredox Organocatalysis

■ Zn-PYI1 competent catalyst in the α -alkylation of aldehydes

- Enamine formed at organocatalytic site from aldehyde substrate
- Triphenylamine motif reduces bromomalonate through SET event
- C–C bond formation occurs within pore in an asymmetric manner

Cooperative Catalysis - Photoredox Organocatalysis

■ Zn-PYI1 competent catalyst in the α -alkylation of aldehydes

- Enamine formed at organocatalytic site from aldehyde substrate
- Triphenylamine motif reduces bromomalonate through SET event
- C–C bond formation occurs within pore in an asymmetric manner

$$E_{1/2} (\text{Zn-PYI1}^+/\text{Zn-PYI1}^*) = -2.12 \text{ V vs. SCE}$$

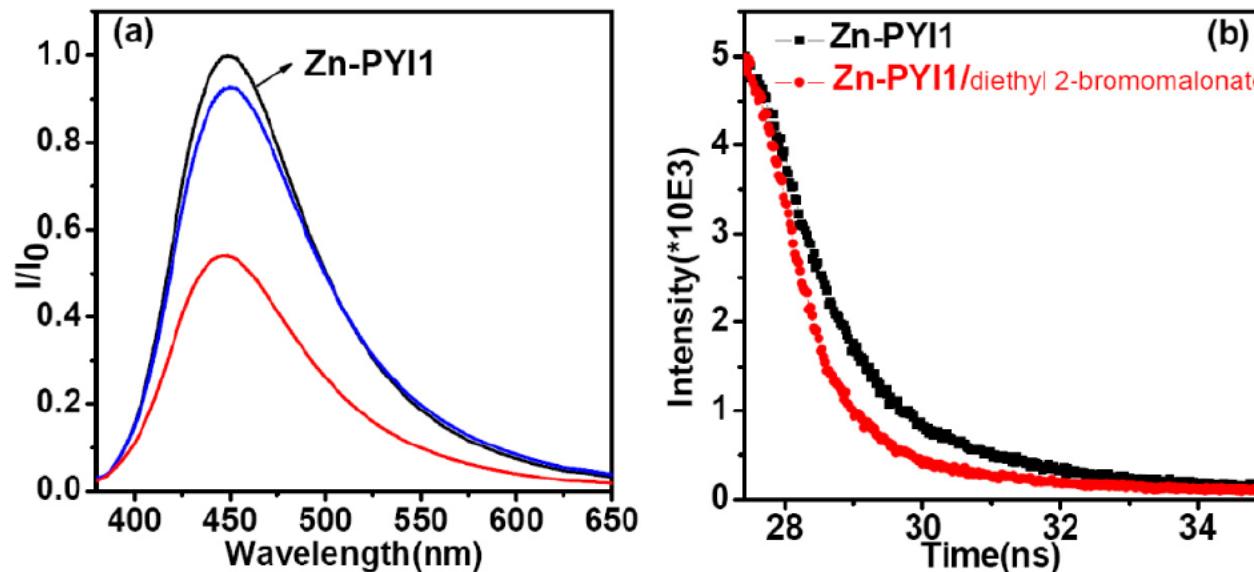

$$E_{1/2} (\text{Zn-PYI1}^+/\text{Zn-PYI1}) = +0.84 \text{ V vs. SCE}$$

$$E_{1/2}^{\text{red}} (\text{diethyl 2-bromomalonate}) = -0.49 \text{ V vs. SCE}$$

Cooperative Catalysis - Photoredox Organocatalysis

■ Zn-PYI1 competent catalyst in the α -alkylation of aldehydes

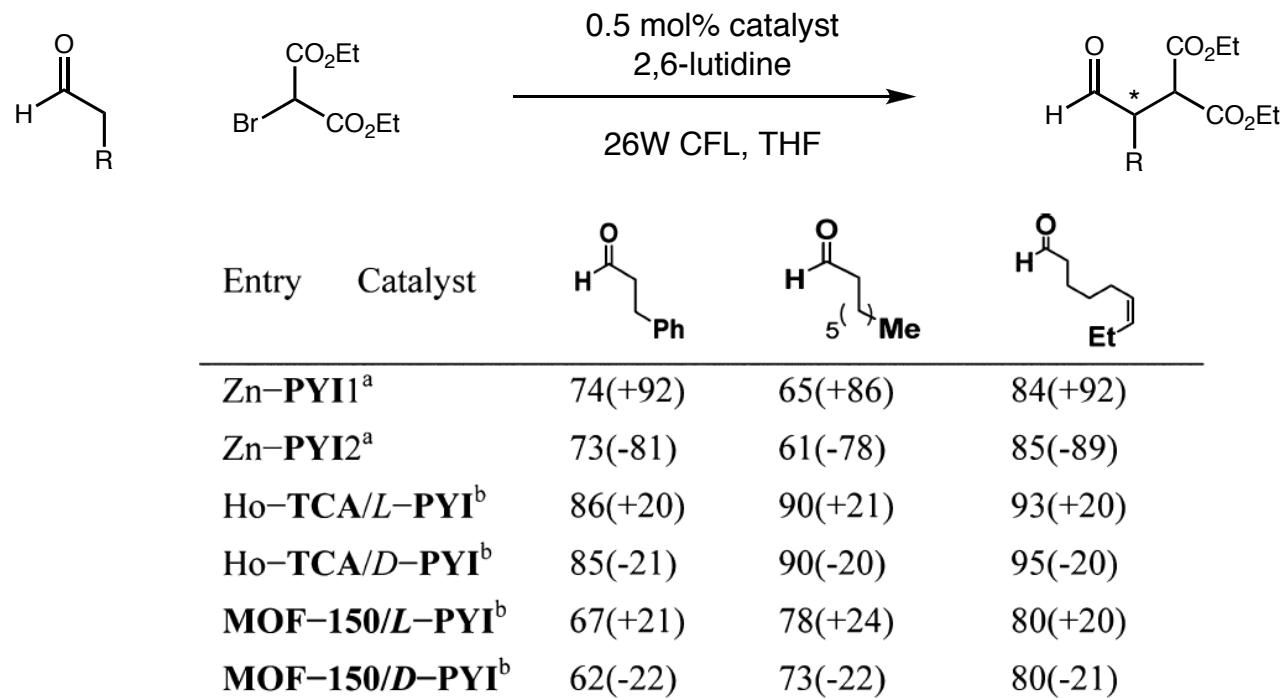

- ^1H NMR confirmed 1 equiv. aldehyde adsorbed per pyrrolidine moiety
- Luminescence intensity decreased upon addition of bromomalonate but not aldehyde
- Supports mechanistic hypothesis that reduction of bromomalonate occurs first

Cooperative Catalysis - Photoredox Organocatalysis

■ Zn-PYI1 competent catalyst in the α -alkylation of aldehydes

- High reaction efficiency and enantioselectivity: % yield (% ee)
- Control experiments show that deprotected Zn-PYI is necessary for any reactivity
- Reaction is heterogeneous in nature and the catalyst can be recycled

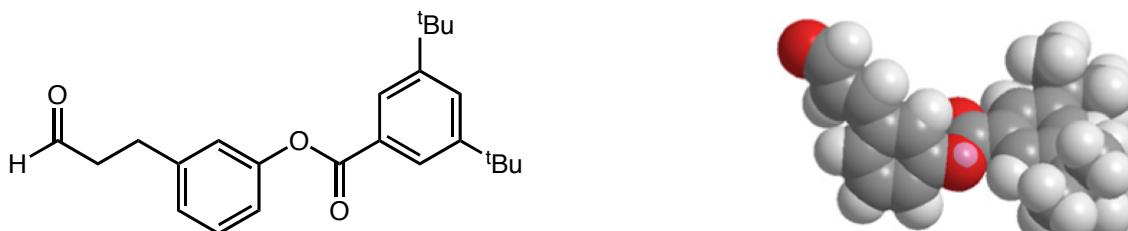

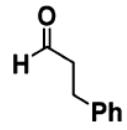

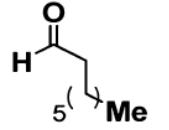

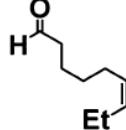

Cooperative Catalysis - Photoredox Organocatalysis

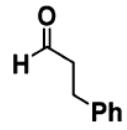

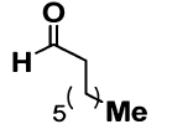

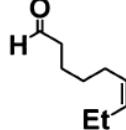

■ Zn-PYI1 compared to other photoactive MOFs: Ho-TCA and MOF-150

- Differences in reaction efficiency attributed to redox potentials
- Superior % ee with **Zn-PYI1** due to restricted environment within pores
- Use of bulky aldehydes unsuccessful, demonstrating catalysis occurs primarily within pores

7% yield

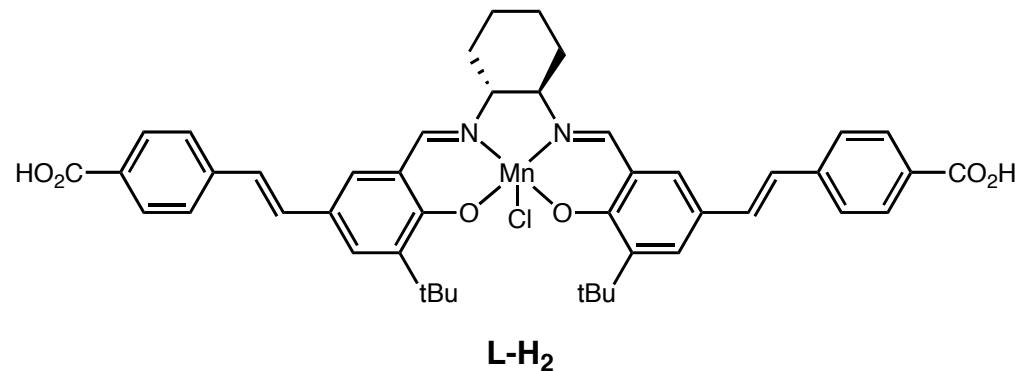

Entry Catalyst   

Entry	Catalyst			
Zn-PYI1 ^a		74(+92)	65(+86)	84(+92)
Zn-PYI2 ^a		73(-81)	61(-78)	85(-89)
Ho-TCA/L-PYI ^b		86(+20)	90(+21)	93(+20)
Ho-TCA/D-PYI ^b		85(-21)	90(-20)	95(-20)
MOF-150/L-PYI ^b		67(+21)	78(+24)	80(+20)
MOF-150/D-PYI ^b		62(-22)	73(-22)	80(-21)

Sequential Asymmetric Catalysis

■ Lin and coworkers combined metal node and Mn(salen) linker catalysis for sequential reactions

- Installation of **L-H₂** linker with Zn(NO₃)₂•6H₂O produces two structurally unique MOFs
- DEF yields **CMOF-1** while DBF yields **CMOF-6'**

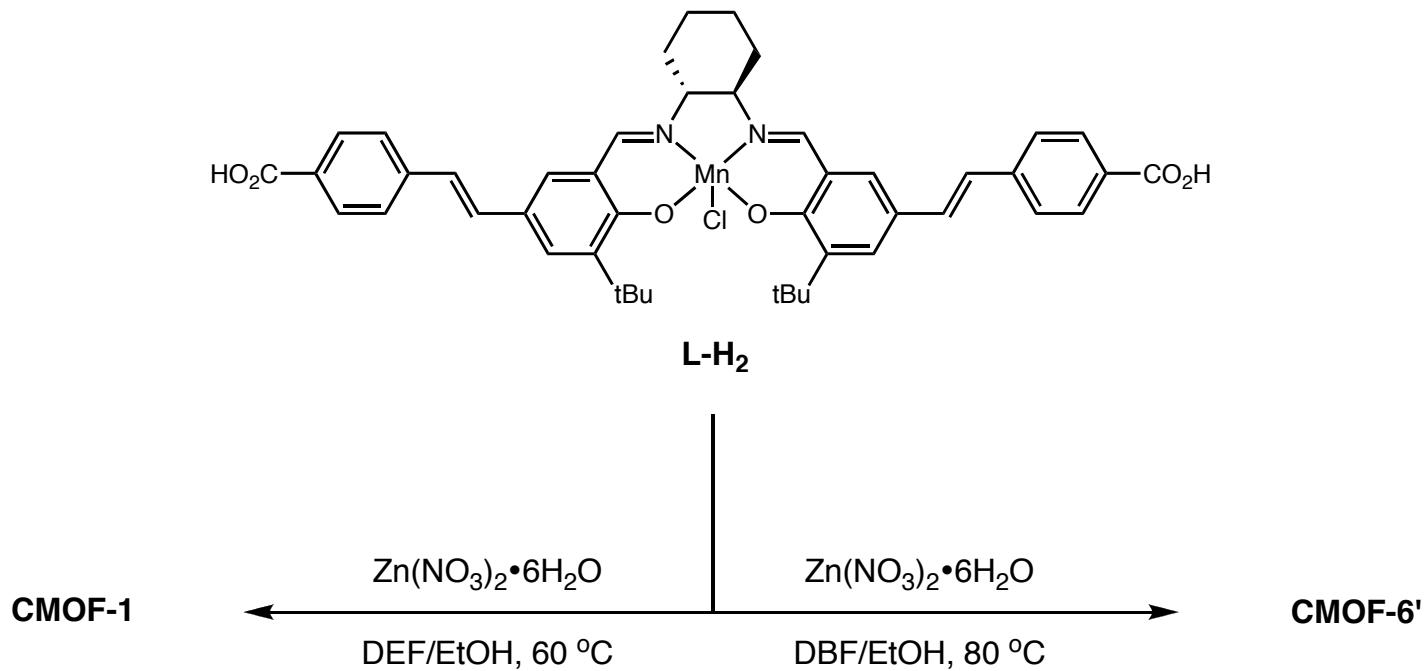

Song, F.; Wang, C.; Lin, W. *Chem. Commun.* **2011**, 47, 8256-8258.

Song, F.; Zhang, T.; Wang, C.; Lin, W. *Proc. R. Soc. A.* **2012**, 468, 2035-2052.

Sequential Asymmetric Catalysis

■ Lin and coworkers combined metal node and Mn(salen) linker catalysis for sequential reactions

- Installation of **L-H₂** linker with Zn(NO₃)₂•6H₂O produces two structurally unique MOFs
- DEF yields **CMOF-1** while DBF yields **CMOF-6'**

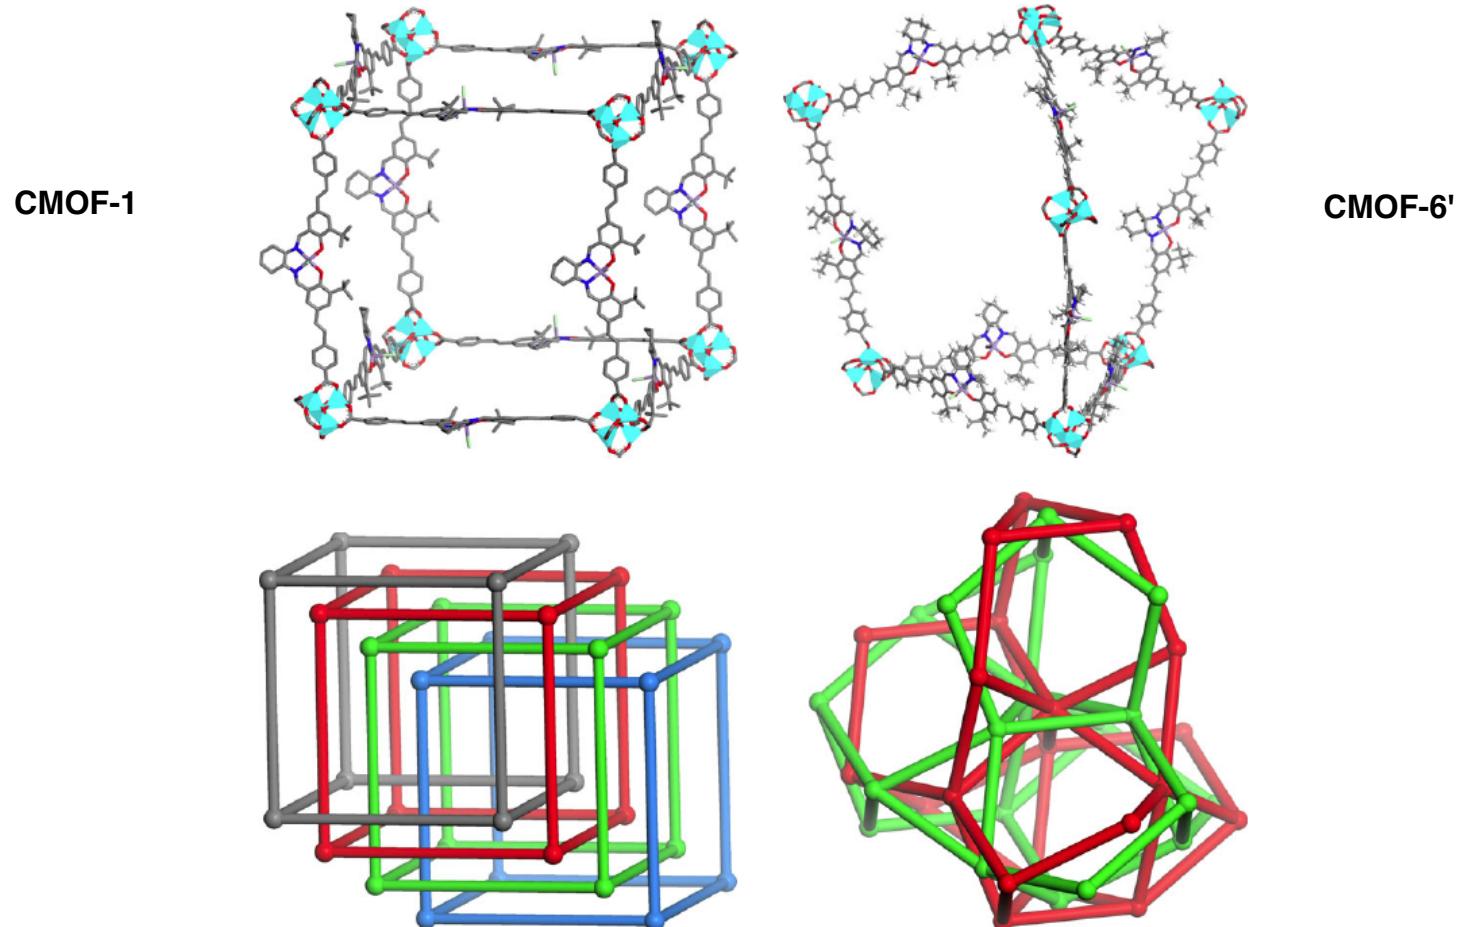

Song, F.; Wang, C.; Lin, W. *Chem. Commun.* **2011**, 47, 8256-8258.

Song, F.; Zhang, T.; Wang, C.; Lin, W. *Proc. R. Soc. A.* **2012**, 468, 2035-2052.

Sequential Asymmetric Catalysis

■ CMOF-1 is cubic (4-fold interpenetration), CMOF-6' is cuboctahedral (2-fold interpenetration)

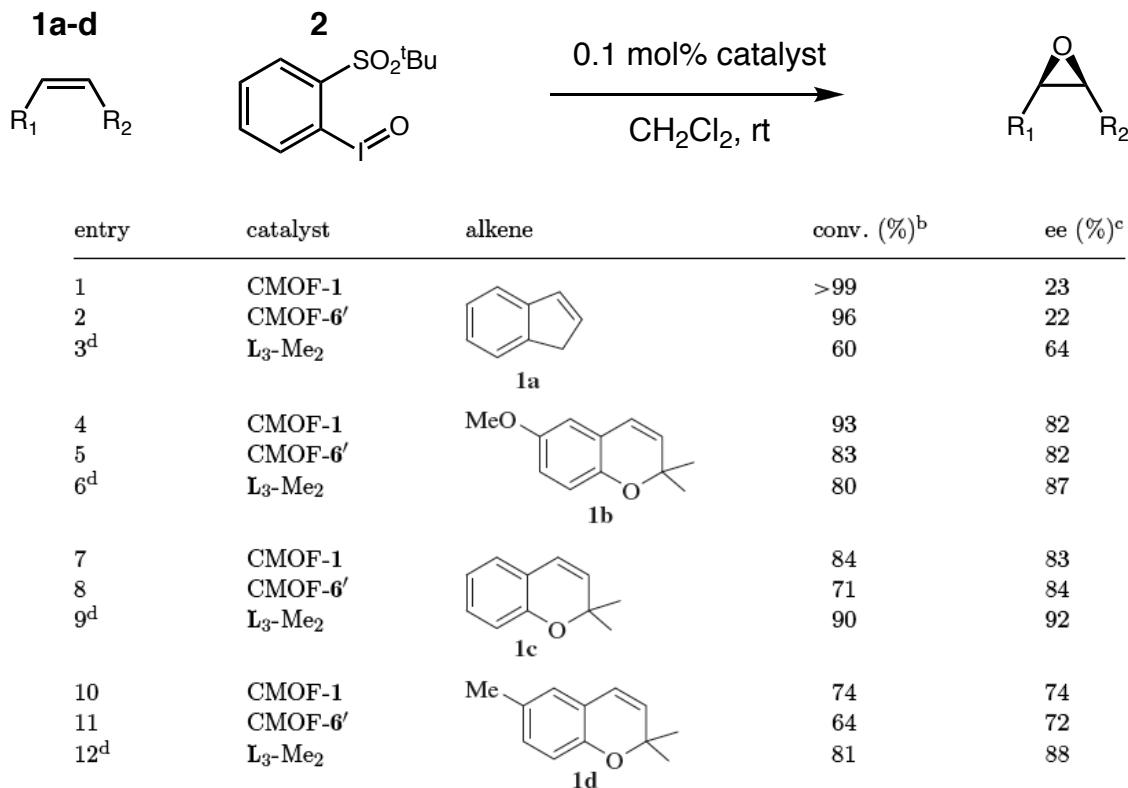

Song, F.; Wang, C.; Lin, W. *Chem. Commun.* **2011**, 47, 8256-8258.

Song, F.; Zhang, T.; Wang, C.; Lin, W. *Proc. R. Soc. A.* **2012**, 468, 2035-2052.

Sequential Asymmetric Catalysis

■ CMOF-1 and CMOF-6' catalyze sequential epoxidation-epoxide opening reaction

- Mn(salen) linkers catalyze the asymmetric epoxidation of alkenes
- Zn SBUs catalyze the stereo and regioselective epoxide opening

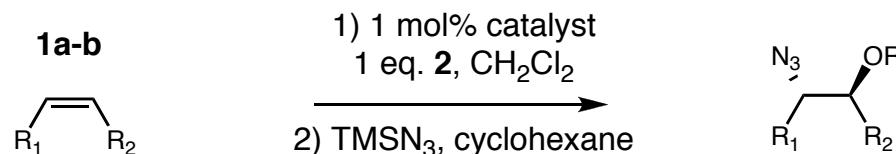

Song, F.; Wang, C.; Lin, W. *Chem. Commun.* **2011**, 47, 8256-8258.

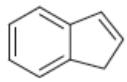

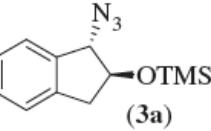

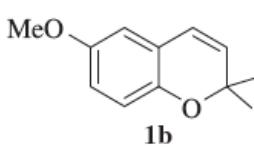

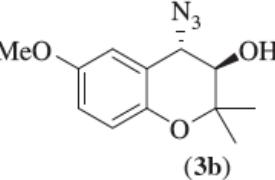

Song, F.; Zhang, T.; Wang, C.; Lin, W. *Proc. R. Soc. A.* **2012**, 468, 2035-2052.

Sequential Asymmetric Catalysis

■ CMOF-1 and CMOF-6' catalyze sequential epoxidation-epoxide opening reaction

- Homogeneous Mn(salen) linkers do not effect epoxide opening (< 5% yield)
- Single regioisomer and diastereomer

entry	catalyst	alkene	product	conv. (%) ^a	ee (%) ^b
1	CMOF-1		 (3a)	40	39 (39)
2	CMOF-6'			60	50 (48)
3	CMOF-1		 (3b)	41	86 (84)
4	CMOF-6'			57	81 (82)

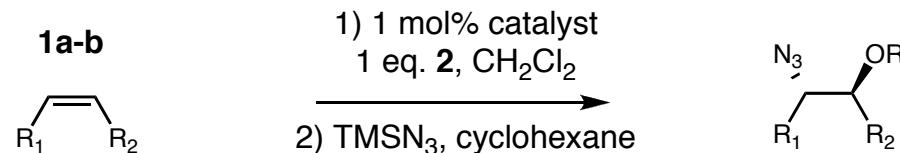

Song, F.; Wang, C.; Lin, W. *Chem. Commun.* **2011**, 47, 8256-8258.

Song, F.; Zhang, T.; Wang, C.; Lin, W. *Proc. R. Soc. A.* **2012**, 468, 2035-2052.

Sequential Asymmetric Catalysis

■ CMOF-1 and CMOF-6' catalyze sequential epoxidation-epoxide opening reaction

- Homogeneous Mn(salen) linkers do not effect epoxide opening (< 5% yield)
- Single regioisomer and diastereomer

- Lower yield for CMOF-6' in epoxidation step due to less accessible Mn(salen) sites
- Larger channel sizes in CMOF-6' = higher sequential catalytic activity
- Isolation of multiple active sites in MOF scaffold enable successful tandem catalysis

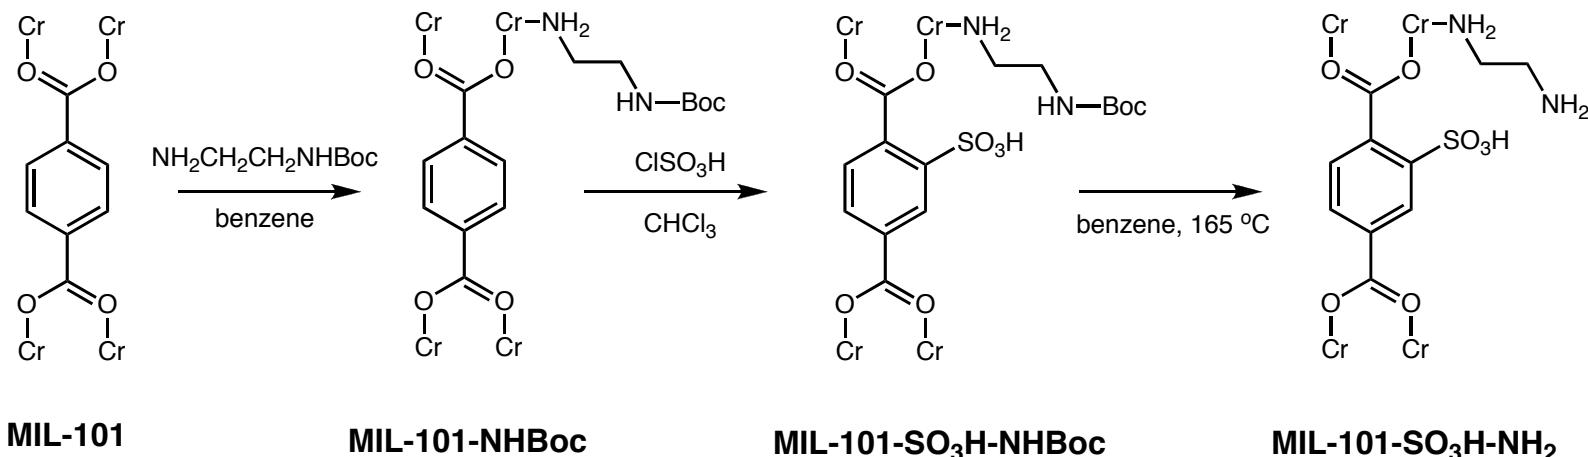

Song, F.; Wang, C.; Lin, W. *Chem. Commun.* **2011**, 47, 8256-8258.

Song, F.; Zhang, T.; Wang, C.; Lin, W. *Proc. R. Soc. A.* **2012**, 468, 2035-2052.

Tandem Catalysis - Organo-bifunctionalization

■ Shi and coworkers used PSM to install multiple catalytic sites on **MIL-101**

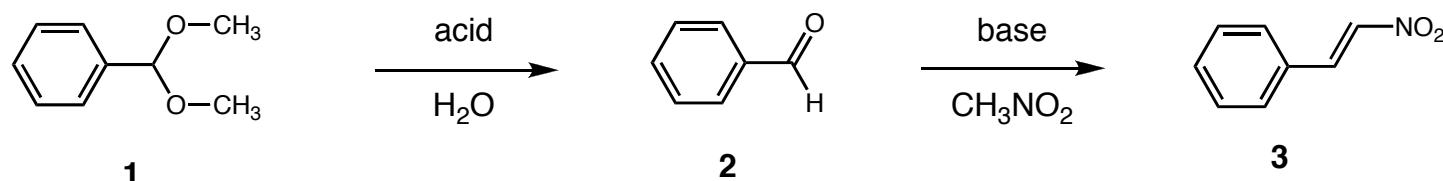

- First example of an organo-bifunctionalized MOF
- Grafting a functional group onto a coordinately unsaturated metal node (step 1)
- Installing second functional group onto organic linker (step 2)
- **MIL-101-SO₃H-NH₂** contains both Lewis acidic and Lewis basic catalytic sites

Tandem Catalysis - Organo-bifunctionalization

■ MIL-101-SO₃H-NH₂ tested in tandem acetal hydrolysis-Henry reaction

- Bifunctionalized MOF functioned far superior to monofunctionalized MOFs
- Homogeneous mixture of free acid and base showed no activity
- **MIL-101** was less efficient despite open Cr³⁺ Lewis acidic site (87% conversion after 24 hr)

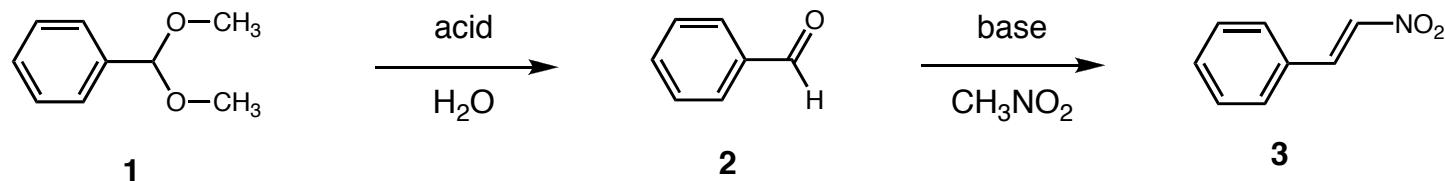

Entry	Catalyst	Conv. of 1 [%]	Yield of 2 [%]	Yield of 3 [%]
1	MIL-101-SO₃H-NH₂	100	3	97
2	MIL-101-SO₃H-NHBoc	100	100	Trace
3	MIL-101-NH₂	Trace	Trace	Trace
4	MIL-101-SO₃H	100	100	0
5	MIL-101-SO₃H-NH₂ + <i>p</i> -toluene sulfonic acid	100	95.5	4.5
6	MIL-101-SO₃H-NH₂ + ethylamine	Trace	Trace	Trace
7	<i>p</i> -Toluene sulfonic acid + ethylamine	Trace	Trace	Trace

Tandem Catalysis - Organo-bifunctionalization

■ **MIL-101-SO₃H-NH₂** tested in tandem acetal hydrolysis-Henry reaction

- Bifunctionalized MOF functioned far superior to monofunctionalized MOFs
- Homogeneous mixture of free acid and base showed no activity
- **MIL-101** was less efficient despite open Cr³⁺ Lewis acidic site (87% conversion after 24 hr)

- **MIL-101-SO₃H-NH₂** demonstrates new PSM strategy to bifunctionalize MOFs
- Grafting method allows facile diversification
- Important example: multifunctional catalysis in MOFs opens up new areas of reactivity

The Future of MOF Catalysis

■ Numerous advantages to employing MOF-based heterogeneous catalysis

- Customizable scaffold and microporosity enables diverse yet controllable reactivity
- Incorporation of homogeneous analogs allow for asymmetric catalysis
- Easy post-reaction separation and recyclability
- Enhanced catalyst stability and substrate size selectivity

The Future of MOF Catalysis

■ Numerous advantages to employing MOF-based heterogeneous catalysis

- Customizable scaffold and microporosity enables diverse yet controllable reactivity
- Incorporation of homogeneous analogs allow for asymmetric catalysis
- Easy post-reaction separation and recyclability
- Enhanced catalyst stability and substrate size selectivity

■ What's next?

- Multifunctional catalysis that cannot be accessed in a homogeneous manner
- "Enzyme mimics" - defined chiral environments for substrate binding, orientation, and catalysis
- Cascade catalysis - formation of complex products from simple substrates due to multiple catalytic sites
- Bottom line: demonstrating catalysis that is unique to metal-organic frameworks
